Abstract (en)

[origin: WO2023107236A1] Methods and systems to selectively output access-protected information associated with a code based on biometric data of person from who the code is obtained. An embodiment includes outputting first information upon capture of the code and outputting second information if biometric data obtained from the person matches biometric data associated with the code. The first information may be extracted from the code and the second information may be retrieved from a remote storage device. The biometric data associated with the code may be extracted from the code or retrieved from the remote storage device. The first information may include personal identification information. The second information may include, without limitation, access-protected information, personal medical information, an indication that the person is a member of an at-risk group, or an indication that the person is suspected of involvement in illicit activity. Outputting the first information may be omitted.
