Abstract (en)

The present invention provides an antibody combination that can be used to detect regenerating islet-derived protein 1 α (REG1A), each antibody in the antibody combination can specifically bind to REG1A with high affinity so as to form a double-antibody sandwich form, thereby enabling qualitative and quantitative detection of human REG1A. The antibody combination or an ELISA detection kit comprising the antibody combination can be used for auxiliary diagnosis or disease risk prediction of REG1A-related diseases.
