Abstract (en)

[origin: WO2023001549A1] The present invention relates to a system for assisting with provision of diagnostic information, especially with a view to detecting a disease in a person, especially a contagious disease such as COVID-19, this detecting system comprising: - a device for acquiring examination data on the person, this acquiring device comprising at least two sensors for measuring a given physiological measurement, such as a radar and a thermal camera, to acquire these examination data, these sensors especially being arranged to work without contact with the person, - a data-processing device arranged to receive these data obtained by the sensors of the acquiring device, this processing device further being arranged to fuse data delivered at least by the two sensors of the acquiring device especially with a view to increasing the robustness of the examination data acquired on the person.
