Abstract (en)

[origin: WO2023001988A1] The invention relates to an injection device for subcutaneously administering a maximum content of a product container through a cannula at a distal end of the product container, comprising a device housing (2) having an opening at a proximal end, a module housing (17) for covering the opening, which module housing is separable from the device housing by a separating operation, a drive (9, 13), which is arranged in the device housing, for moving an advancing element (7) and for the one-time automatic ejection of the contents of the product container. An electronics module (16) is held in the module housing, with a sensor (16a) for detecting the discharging, and a mechanical securing mechanism (19) is provided for enabling the separating operation as or after the automatic ejection is triggered.
