Abstract (en)

[origin: US2023021987A1] A controller may receive a first input indicating that a machine is performing a lifting operation. The controller may determine that the machine is operating in a first lifting mode associated with a first lifting capacity during the lifting operation. In the first lifting mode, a pressure of a hydraulic pump of the machine is between a first value and a second value that exceeds the first value. The controller may receive sensor data indicating a current value for the pressure, during the lifting operation. The controller may determine that the current value is approaching the second value. The controller may receive a second input indicating that the machine is continuing to perform the lifting operation. The controller may cause, based on the second input, the machine to transition from operating in the first lifting mode to operating in a second lifting mode associated with a second lifting capacity.
