Abstract (en)

[origin: WO2023006804A1] The invention relates to a winder for winding a material web (122, 123). The aim of the invention is to provide a winder with which a reliable transport of the film roll (116, 117) in the transfer station (137, 138) can be ensured. This is achieved in that the winder according to the invention comprises a feed station (133, 134) for conveying the material web into the winder, a winding station (135, 136) for winding the material web conveyed by the feed station onto a film roll, a changing station (139, 140) for changing the material web from the wound film roll onto a new winding core on the fly, and a transfer station (137, 138) in which the wound film roll can be removed from the winder for further processing. The transfer station has a lifting gear (120, 121) which is connected to at least one flat belt (205) in order to lift or lower the wound film roll.
