Abstract (en)

[origin: WO2023043961A1] A light secure image light guide including an image source operable to generate image-bearing light beams and a waveguide operable to propagate the image-bearing light beams. An in-coupling diffractive optic formed along the waveguide, wherein the in-coupling diffractive optic is operable to diffract a portion of the image-bearing light beams from the image source into the waveguide in an angularly encoded form, and an out-coupling diffractive optic formed along the waveguide, wherein the out-coupling diffractive optic is operable to expand the portion of image-bearing light beams, direct a first portion of expanded image-bearing light beams from the waveguide in an angularly decoded form in a first direction toward an eyebox, and direct a second portion of expanded image-bearing light beams from the waveguide in a second direction different from said first direction. The image light guide further including an optical device operable to reduce, eliminate, and/or block the second portion of expanded image-bearing light beams output from the image light guide in the second direction.
