Abstract (en)

[origin: WO2023020847A1] The subject of the present invention is a frame (13) of a mobile work machine, having a lateral loading area portion (14) oriented parallel to a longitudinal direction of the frame (13) and having a transport magazine (15) which is movable from a transport position engaging at least partially over the lateral loading area portion (14) into a removal position located next to and beneath the transport position, wherein the frame (13) furthermore has an adjusting device (17) for moving the transport magazine (15) between the transport position and the removal position, which comprises first linear kinematics for shifting the transport magazine (15) along a first axis and second linear kinematics for shifting the transport magazine (15) along a second axis. On account of the first and second linear kinematics, the adjusting device allows a structurally simple design and flexible positionability of the transport magazine.
