Abstract (en)
[origin: WO2023025766A1] The present invention relates to a laundry detergent composition having a desirable foam profile during the laundering process. It is thus an object of the present invention to provide a detergent composition which provides good foam profile. It is yet another objection of the present invention to provide a detergent composition which reduces the amount of water required for rinsing. The present inventors have found that a detergent composition having specifically selected primary anionic deterative surfactant when present in combination with cosurfactant and a foam suppressing agent surprisingly provides good foam formation in the wash stage while eliminating the foam quickly during the rinsing stage.
