Abstract (en)

[origin: WO2023025630A1] The present invention relates to a timepiece comprising a dial (1) having at least one window (2), a device (4') for closing said window (2) comprising at least one closing member (5) and a control mechanism arranged to be able to drive said closing member (5), said closing member (5) being movable between a closed position, in which it closes the window (2), and an open position, in which it leaves the window (2) at least partially free. Said closing device (4) comprises at least one attachment part (8) attached to the dial (1) and connected to the closing member (5) by at least one resilient guide system (10) arranged to guide a rotational movement of the closing member (5) with respect to the attachment part (8) about a virtual axis of rotation Z in a plane XY perpendicular to the axis Z and substantially parallel to the window (2) of the dial (1), between its two, open and closed, positions.
