Abstract (en)
Provided is a riding mower. The riding mower includes a mowing assembly including a mowing element and a deck accommodating at least part of the mowing element; a traveling assembly including at least left traveling wheels and right traveling wheels; a traveling electric motor for driving the traveling assembly; a grass collecting pipe connected to the deck to guide grass clippings; and a power supply device configured to supply power to the traveling electric motor. The projection of the grass collecting pipe on a first plane supporting the traveling assembly is at least partially located between the left traveling wheels and the right traveling wheels. The maximum total energy of the power supply device is greater than or equal to 0.5 kW h and less than or equal to 6 kW h. Through the preceding technical solution, the riding mower with the grass collecting pipe in the middle can be provided, the power supply device supplies electrical energy to the riding mower, and the riding mower has better mowing and grass collecting efficiency when automatically traveling.
