Abstract (en)  
An aerosol generating apparatus, comprising a body (1), an extractor (2) that is slidably sleeved on the body (1) and that is internally provided with an accommodating space (220) for accommodating an aerosol-forming matrix (200), and a heating body (14) which is disposed on the body (1) and one end of which is capable of extending into the accommodating space (220). The extractor (2) comprises an elastic component (23): when the extractor (2) is in a connected state with the body (1), the aerosol-forming matrix (200) is located at a first position that can be heated by the heating body (14); and when the extractor (2) is in a separated state from the body (1), the heating body (14) is at least partially disengaged from the accommodating space (220), so that the aerosol-forming matrix (200) is located at a second position that is at least partially separated from the heating body (14), and the elastic assembly (23) is used to change the length of the accommodating space (220) during a process in which the extractor (2) and the body (1) separate from being connected.
