Abstract (en)  
[origin: WO2024112329A1] A transport and delivery system which may be used for injectable materials such as radioactive injectables. The system includes a base configured to hold a material transport device containing the injectable material, and a cover including a material delivery system and a material access device. The cover is configured to be mated over the base to result in alignment of the material access device with the material transport device to allow the material delivery system to deliver the injectable materials from within the material transport device to a patient. The cover may include a handle graspable within an adult hand to facilitate grasping / handling of the system. A priming cap may be provided to facilitate priming of the material delivery system and material access device to be substantially airless.
