Abstract (en)

[origin: WO2023031008A1] The invention relates to a connecting disc for connecting at least two scaffold elements, comprising: a basic body having a first main surface and a second main surface which is disposed opposite the first main surface, and having an edge surface which runs round the basic body and connects the first main surface and the second main surface to one another; at least one longitudinal connecting opening which passes completely through the basic body; and at least two transverse connecting openings, each of which passes completely through the basic body, each transverse connecting opening being delimited by a peripheral contour in a plan view of the first main surface, said peripheral contour having a receiving region and at least one blocking region which interrupts the receiving region and is disposed outside the receiving region. The at least two transverse connecting openings are disposed on mutually opposing sides of the longitudinal connecting opening, the blocking regions of the at least two transverse connecting openings are directed away from one another. The invention further relates to a standard having a connecting disc and to a scaffold section having a standard.
