Abstract (en)

[origin: WO2023031559A1] The invention relates to a method for manufacturing an opacifying device (1) for windows (3) or walls that are at least partially transparent, the manufacturing method comprising the following steps: obtaining a polarizable part including a central layer, two conducting layers (9) surrounding the central layer, and two insulating layers surrounding the conducting layers (9); removing a portion of the polarizable part; obtaining two covering layers made from an electrically insulating material; depositing a conducting entity (16) on each covering layer; securing the covering layers to the polarizable part, each conducting track (17) having a free portion outside of the electrical connection access and able to be electrically connected to an external conductor (19).
