Abstract (en)

[origin: WO2023052439A2] The present invention relates to a device for creating a three-dimensional packaging product from a starting material in the form of a web, comprising: a pre-shaping station which shapes the web of starting material into a three-dimensional intermediate product having at least one crumple cavity extending in the web direction; a cutting station downstream of the pre-shaping station in the conveying direction of the starting material, which cutting station cuts a packaging product of the required length from the web of starting material; and an outputting device downstream of the cutting station in the conveying direction of the starting material, which outputting device has a pair of opposing continuous conveyors for discharge-conveying the cut packaging product, wherein one continuous conveyor is mounted so as to be movable relative to the other continuous conveyor in order to enable access between the continuous conveyors.
