Abstract (en)
[origin: WO2023066713A1] The invention relates to a system for securing a load-handling environment of load-handling kinematics (30) in a changing work environment, the system comprising an environment-sensing unit which is configured to acquire data from the load-handling environment, and an environment-monitoring unit which is operatively connected to the environment-sensing unit, characterised in that the environment-monitoring unit is configured to analyse the data in such a way that a space (7) surrounding a load to be handled, a work space (12, 13, 14, 60) defined by a movement range of the load-handling kinematics (30), and a process space (40, 50) are determined by addition of the work space (12, 13, 14, 60) and a distance space, wherein the environment-monitoring unit is configured to monitor at least the distance space and/or the process space (40, 50) at least in part.
