Abstract (en)

An object of the present disclosure is to improve convenience. A relay (3) is configured to relay communication between each of a plurality of detectors (2) and a receiver (1). The relay (3) includes a first communication unit (31) and a registration processor (363). The communication unit (31) is configured to perform communication with the plurality of detectors (2) which have been registered with the storage (33). The registration processor (363) is configured to perform a registration process of registering the plurality of detectors (2) with the storage (33). The registration processor (363) registers each of the plurality of detectors (2) with the storage (33) such that the plurality of detectors (2) are sorted according to whether each of the plurality of detectors (2) is a first detector (201) or a second detector (202). The second detector (202) is different from the first detector (201) in terms of a communication protocol.
