Storage medium containing an interactive graphics data stream, and apparatus and method for reproducing the same

A storage medium storing: video data; and graphics data for displaying a menu overlaid on an image displayed on the basis of the video data. The graphics data includes first graphics data displayed on the screen when an activation command is generated by a user and may also include second graphics data displayed on the screen at a designated time.

Description

[0001] The present invention relates to reproduction of a multimedia image, and more particularly, to a storage medium storing an interactive graphics stream displayed in response to a user's command, and a reproducing apparatus and method for reproducing from the same.

[0002] To reproduce a multimedia image, audio-visual (AV) data of the multimedia image, navigation data controlling reproduction of the AV data, and system data including command information related to a title of AV data to be initially reproduced when the storage medium is inserted in a reproducing apparatus are recorded in a storage medium. Other data can also be recorded in the storage medium. In particular, the AV data is recorded in the storage medium by multiplexing video, audio, subtitles, and a menu as a main stream.

[0003] Figure 1 is a block diagram of general AV data recorded in a storage medium.

[0004] Referring to Figure 1, in a storage medium storing a multimedia image, a video stream 102, an audio stream 104, a presentation graphic stream 106, and an interactive graphics stream 108 are multiplexed (MUX) and transmitted to the demultiplexers 220 through 260, respectively. Each stream transmitted to the respective decoders is decoded according to a corresponding data type and ready to be displayed on a screen at a designated time. The decoded video stream 102, the presentation graphic stream 106, and/or the interactive graphics stream 108 are overlaid as a single image using a blender 270. Finally, an image selected based on an output status set by a user is displayed on the screen. For example, an output status can be controlled based on a user's selection such as a subtitle on/off status and a mute status, etc.

[0005] Figure 2 is a block diagram of a general reproducing apparatus for reproducing AV data from a storage medium 200 in which the AV data 110 is recorded.

[0006] Referring to Figure 2, a reproducing apparatus for reproducing a multimedia image reads navigation data, as described above, and obtains control information required for reproducing the AV data 110. For example, the control information includes a coding type of the AV data 110, a bit rate, information indicating an area in which the AV data 110 is recorded, and the type of data included in the AV data 110. By referring to the control information, a reading unit 210, a demultiplexer 220, video, presentation, interactive graphics, and audio decoders 230, 240, 250, and 260, respectively, are controlled.

[0007] In detail, with concurrent reference to Figures 1 and 2, the reading unit 210 reads multiplexed AV data 110 from a storage medium 200 using the information indicating the area in which the AV data 110 is recorded and transmits the multiplexed AV data 110 to the demultiplexer 220. The demultiplexer 220 divides the received AV data 110 into the video stream 102, the audio stream 104, the presentation graphic stream 106, and the interactive graphics stream 108 and transmits the divided streams 102 through 108 to the decoders 230 through 260, respectively. Each stream transmitted to the respective decoder is decoded according to a corresponding data type and ready to be displayed on a screen at a designated time. The decoded video stream 102, the presentation graphic stream 106, and/or the interactive graphics stream 108 are overlaid as a single image using a blender 270. Finally, an image selected based on an output status set by a user is displayed on the screen. For example, an output status can be controlled based on a user's selection such as a subtitle on/off status and a mute status, etc.

[0008] In particular, the interactive graphics decoder 250 receives the interactive graphics stream 108 from the storage medium 200, decodes the interactive graphics stream 108, and outputs a menu screen including buttons on the screen at a designated time. A user's selection can be input by the user selecting a specific button on the output menu screen. That is, a user interactive function can be provided.

[0009] However, a conventional reproducing apparatus unconditionally outputs a menu screen at a designated time even if a user does not want to watch the menu when reproducing multimedia such as a movie. If an undesired menu screen is displayed when viewing a movie, a user may be inconvenienced.

[0010] According to the present invention there is provided an apparatus and method as set forth in the appended claims. Preferred features of the invention will be apparent from the dependent claims, and the description which follows.

[0011] Embodiments of the present invention provide a storage medium storing an on-demand interactive graphics stream activated in response to a user's command by expanding an interactive graphics stream function for supporting a user interactive operation, and a reproducing apparatus and method for reproducing from the same.

[0012] According to an aspect of the present invention, there is provided a storage medium comprising video data and graphics data for displaying a menu screen overlaid on an image displayed on the basis of the video data. The graphics data includes first graphics data displayed on the screen when an activation command is generated by a user.

[0013] The graphics data may also include second graphics data displayed on the screen at a designated time.

[0014] The first and second graphics data may have identical or similar structures which include a field for discriminating from each other.

[0015] The first and second graphics data may have graphics_segment structures which include segment_type fields defining first and second graphics data type values, respectively.

[0016] The first and second graphics data may have interactive_graphic_segment structures, which include a type field for discriminating from each other.

[0017] The first graphics data may have an on_demand_interactive_graphic structure different from the structure of the second graphics data. The on_demand_interactive_graphic structure may include information regarding an initial menu page indicating that the first graphics data is decoded and ready to be displayed and information regarding at least one menu...
According to another aspect of the present invention, there is provided a reproducing apparatus for reproducing from a storage medium video data and graphics data for displaying a menu overlaid on an image displayed on the basis of the video data, including: a video decoder which decodes video data; and a graphics decoder which decodes graphics data. The graphics decoder decodes first graphics data displayed when the graphics data is of a specified type and an activation command is received. The second graphics data is displayed at a designated time when the graphics data is not of the first type.

According to another aspect of the present invention, there is provided a reproducing method for reproducing from a storage medium video data and graphics data for displaying a menu overlaid on an image displayed on the basis of the video data. The method includes decoding graphics data, and on the basis of the decoded graphics data, outputting the decoded graphics data when an activation command is generated by the user or outputting the decoded graphics data at a designated time.

According to still another aspect of the present invention, there is provided a reproducing method for reproducing an interactive graphics stream from a storage medium, including: reading an interactive graphics stream from the storage medium; decoding the read interactive graphics stream; determining a type of the read interactive graphics stream, and blending the decoded interactive graphics stream with video data and one of displaying the blended data at a designated time when the decoded interactive graphics stream is normal interactive graphics stream and displaying the blended data when an activation command is received when the decoded interactive graphics stream is an on-demand interactive graphics stream.

According to yet another aspect of the present invention, there is provided an interactive graphics decoder, including: a stream graphics processor which decodes a received interactive graphic stream and transmits button image object data and button configuration information after the decoding; a coding data buffer which temporarily stores an interactive graphics stream and then transmits the interactive graphics stream to a stream graphics processor; an object buffer which receives the button image object data; a composition buffer which receives the button configuration information; and a graphics controller which builds an image to be displayed using data stored in the object buffer and the composition buffer and transmits the determined image from the object buffer to a graphics plane.

Additional and/or other aspects and advantages of the present invention will be set forth in part in the description which follows, and in part, will be obvious from the description, or may be learned by practice of the invention.

These and/or other aspects and advantages of the invention will become apparent and more readily appreciated from the following description of the embodiments, taken in conjunction with the accompanying drawings of which:

Figure 1 is a view of conventional AV data recorded in a storage medium;

[0027] Reference will now be made in detail to the embodiments of the present invention, examples of which are illustrated in the accompanying drawings, wherein like reference numerals refer to the like elements throughout. The embodiments are described below to explain the present invention by referring to the figures.

[0028] As used in the present Specification, a normal interactive graphics stream refers to a data stream which provides a menu screen at a designated time. Also, as used in the present Specification, an on-demand interactive graphics stream refers to a data stream which provides a menu screen which is displayed only when a user desires.

[0029] Figure 3 illustrates a configuration of an interactive graphics stream according to an embodiment of the present invention.

[0030] Referring to Figure 3, an interactive graphics stream is divided into units of epochs according to how a decoder operates. Information for reproducing a button on a menu screen including a plurality of buttons is called an interactive graphics object. All interactive graphics objects included in an epoch are decoded and stored in an object buffer of an interactive graphics decoder, to be described later, and unless data of a subsequent epoch is input, the stored objects are maintained. Accordingly, in one epoch, the interactive graphics object does not have to be decoded every time it is used, and the already decoded and stored interactive graphics objects can be reused. However, when a subsequent epoch starts after one epoch is finished, all buffers of the decoder are reset, and all stored data disappears. Also, the amount of time after which a buffer of the decoder is reset is defined as a specified time.

[0031] Display sets are defined as output units of the interactive graphics objects, as shown in Figure 3. A display set indicates a set of interactive graphics objects displayed on a single screen, and one epoch can include at least one display set. There are three types of display sets. The first is an epoch start (ES) display set indicating the start of an epoch, and includes all data for outputting an interactive graphics such as interactive graphics configuration information required for configuring the interactive graphics and object data used for a button image. The second is an acquisition point (AP) display set that can exist after the ES display set and includes all information for configuring an interactive graphic to prepare for a situation such as a user's random search. The third is a normal state (NC) display set including data that must be changed among interactive graphics in a previous display set, i.e., only data to be updated. As shown in Figure 3, one epoch can include a plurality of display sets. The ES display set exists at an initial part of an epoch, and AP and NC display sets are located at subsequent positions. An ES display set is necessary for each epoch, but the AP and NC display sets are optional.

[0032] Each display set includes a composition segment storing configuration information of an interactive graphics stream, a plurality of definition segments, each recording object data such as a real image of a button displayed on a screen, and an end segment indicating the end of the display set. The composition segment includes output finish time information, button configuration information, and operation information indicating
how a reproducing apparatus responds to a user operation. The composition segment can be realized with an interactive composition segment (ICS) data structure. The definition segment includes an object definition segment (ODS) including object data having image information of a button and a palette definition segment (PDS) including color information adapted to the ODS.

Each segment in a single display set is recorded in a packetized elementary stream (PES), which is a packet unit of an MPEG-2 transport stream (TS). A relevant display set is decoded at a decoding time indicated by a decoding time stamp (DTS) included in the PES, and is displayed on a screen at a presentation time indicated by a presentation time stamp (PTS). Also, an output finish time when the output of the relevant display set is complete is determined by a composition_time_out_pts field value recorded in the ICS indicating a data structure of the composition segment.

Accordingly, the interactive graphics stream is displayed on the screen at a designated time indicated by the PTS, a user command is received, an operation is performed in response there to, and the interactive graphics stream disappears from the screen at a designated output finish time indicated by composition_time_out_pts. However, if the interactive graphics stream is output using only a designated time, a menu screen is unconditionally output at the designated time even if the user does not want it to. That is, the menu screen can be activated at a time other than when the user wants it to, not just when a user wants it to.

Therefore, according to an embodiment of the present invention, an on-demand interactive graphics stream activated by a user's command is defined by expanding a function of the interactive graphics stream to perform a user interactive operation. To discriminate from the on-demand interactive graphics stream defined in the present invention, the interactive graphics stream output at a designated time is called a normal interactive graphics stream.

The normal interactive graphics stream is displayed on a screen at a designated time and disappears at a later designated time. On the other hand, the on-demand interactive graphics stream is displayed on a screen only when an activation command is generated by a user after all data is decoded and ready to be output, and performs a designated operation in response to an input from the user. That is, in the normal interactive graphics stream, in the on-demand interactive graphics stream, interactive graphics objects such as buttons can first be displayed at a time designated by the PTS. However, in the on-demand interactive graphics stream, the buttons are not displayed on the screen, unless the user inputs a command to do so.

In the normal interactive graphics stream, the composition_time_out_pts indicates a time when data related to the buttons is deleted from the buffer of the decoder. That is, even if a button activation command is generated the user after the output finish time, since the on-demand interactive graphics stream to be activated does not exist any longer, the activation command from the user is ignored.

Figures 4, 5A and 5B are drawings illustrating an operational difference between a normal interactive graphics stream (Figure 4) and an on-demand interactive graphics stream (FIGS 5A and 5B) according to an embodiment of the present invention.

Figure 4 illustrates an operation when a normal interactive graphics stream is reproduced. Referring to Figure 4, normal interactive graphics streams are multiplexed in AV data. Each decoded normal interactive graphics stream is displayed on a screen according to a PTS included in an ICS of an ES display set. Here, a user can navigate or select buttons displayed on the screen. According to a user command, an operation assigned a button is performed.

For example, when navigating a button, a state of the button is changed from a selected state to an unselected state, an output image of the button is changed so as to be suitable for the unselected state, and when the user selects a specific button, an operation according to a navigation command assigned to the specific button is performed. Also, when the command assigned to the specific button is a command to move to another location of the AV data, even if an output finish time (composition_time_out_pts) of the normal interactive graphics stream has not been reached yet, the specific button disappears from the screen, and AV data indicated by the move command is displayed on the screen. On the other hand, when the command assigned to the specific button is not the command to move to another location of the AV data, the command defined to the specific button is performed, an output state of each button is maintained until the output finish time (composition_time_out_pts) is reached, and when the output finish time (composition_time_out_pts) is reached, the specific button disappears from the screen. That is, a normal interactive graphics stream is displayed on a screen at a designated time, and when a designated output finish time is reached, the normal interactive graphics stream disappears from the screen.

Figures 5A and 5B illustrate operations when an on-demand interactive graphics stream is reproduced according to an embodiment of the present invention.

Figures 5A and 5B illustrate operations when an on-demand interactive graphics streams are multiplexed in AV data. When an on-demand interactive graphics stream is decoded, the on-demand interactive graphics stream is ready to be activated. Even if the on-demand interactive graphics stream is ready to be activated, a relevant button is displayed on a screen only if a user's command is generated, in which case, a user command can be received.
The relevant button displayed on the screen disappears from the screen when an output finish time (composition_time_out_pts) is reached. Also, all decoded data in a buffer of a decoder disappears when the output finish time is reached by setting an epoch to the output finish time. Therefore, a user's activation command received after the output finish time is ignored.

[0043] Referring to Figure 5B, with the normal interactive graphics stream shown in Figure 4, an epoch can be defined to terminate before it reaches a subsequent ICS of an ES display set. In this case, since all relevant data in a buffer of a decoder is deleted when the subsequent ICS of the ES display set is reached, even if an output finish time (composition_time_out_pts) has been reached, the relevant data does not have to be deleted from the decoder. However, even if an activation command of a menu is generated by a user after the output finish time is reached, a selected button is not reproduced by recognizing that a valid interactive display duration has ended. That is, a user's activation command received after the output finish time is ignored.

[0044] As described above, an on-demand interactive graphics stream and a normal interactive graphics stream have a identical or similar data structure. However, a difference between the two streams is that the displaying of a button on a screen is determined by a user's activation command in the on-demand interactive graphics stream and by a designated time in the normal interactive graphics stream. That is, if only information for discriminating two types of interactive graphics streams is added, the same data structure can be used for realizing the two types of interactive graphics streams.

[0045] Additional methods of discriminating the on-demand interactive graphics stream from the normal interactive graphics stream are as follows:

First method: a method of discriminating the two streams by using a segment_type field of an ICS

Second method: a method of discriminating the two streams by adding an ICS_type field to the ICS

Third method: a method of discriminating the two streams by defining an On_demand_ICS structure as a new structure of the on-demand interactive graphics stream.

[0046] Figures 6A through 6C illustrate a method (the first method) of discriminating an on-demand interactive graphics stream according to an embodiment of the present invention from a normal interactive graphics stream.

[0047] Referring to Figures 6A and 6B, a graphics_segment structure includes a segment_descriptor 602 which includes a segment_type field 604 indicating a segment type. In Figure 6C, segment types, which the segment_type field 604 can indicate, are defined. In the first method, the segment_type field 604 can be defined such that a normal interactive graphics stream type (Normal_ICS) 606 has a value 0x18 and an on-demand interactive graphics stream type (On_demand_ICS) 607 has a value 0x19. That is, the first method discriminates the two types of interactive graphics streams using the segment_type field 604 when the two types of interactive graphics streams have the same structure.

[0048] Figure 7 illustrates a method (the second method) of discriminating an on-demand interactive graphics stream according to another embodiment of the present invention from a normal interactive graphics stream.

[0049] Referring to Figure 7, on-demand and normal interactive graphics streams have the same structure (interactive_composition_segment), and in the second method, the two types of interactive graphics streams are discriminated using an ICS_type field 702. That is, the ICS_type field is defined so that, if a value of ICS_type is 0, ICS_type indicates a normal interactive graphics stream, and if a value of ICS_type is 1, ICS_type indicates an on-demand interactive graphics stream.

[0050] Figure 8 illustrates a method (the third method) of discriminating an on-demand interactive graphics stream according to another embodiment of the present invention from a normal interactive graphics stream.

[0051] Referring to Figure 8, a newly defined an On_demand_ICS structure is shown. Unlike the first and second methods in which the same structure is used, in the third method, a new structure of an on-demand interactive graphics stream is defined.

[0052] Unlike a structure of a normal interactive graphics stream, the On_demand_ICS structure, the new structure of the on-demand interactive graphics stream defines pages to be configured operation by operation such as an initial menu page including an initial button informing a user that the on-demand interactive graphics stream is decoded and is ready to be activated by the user and pages including buttons to be displayed after the on-demand interactive graphics stream is activated by the user, i.e., a first menu page through an nth menu page. Each menu page to be displayed can include reproduction information of at least one button to be displayed and command information indicating what operation will be performed if the button is selected.

[0053] On the basis of an on-demand interactive graphics stream according to embodiments of the present invention described above, a configuration of a reproducing apparatus supporting the on-demand interactive graphics stream according to an embodiment of the present invention will be described.

[0054] Figures 9 and 10 are block diagrams of reproducing apparatuses for reproducing an on-demand interactive graphics stream according to embodiments of
the present invention.

[0055] Referring to Figure 9, an interactive graphics decoder 910 of a reproducing apparatus according to an embodiment of the present invention is shown. AV data read from a storage medium is input to a packet identifier (PID) filter 902, and only an interactive graphics stream is selectively transmitted to a transport buffer 904 and decoded by the interactive graphics decoder 910.

[0056] In the interactive graphics decoder 910, the interactive graphics stream is temporarily stored in a coding data buffer 912 and then transmitted to a stream graphics processor 914. After the interactive graphics stream is decoded by the stream graphics processor 914, button image object data is transmitted to an object buffer 916, and button configuration information is transmitted to a composition buffer 918. A graphics controller 920 builds output images for received object data with reference to relevant configuration information and transmits the built image to a graphics plane 930. That is, at the time identified by a PTS, an output start time of an interactive graphics stream, the graphics controller 920 determines an image to be displayed on a screen and transmits the determined image from the object buffer 916 to the graphics plane 930. The transmitted image is output with reference to a color lookup table (CLUT) 932 according to color information included in the relevant configuration information. Also, the graphics controller 920 may change a button state according to a move or selection of a button in response to a user command and adapt this result to a screen output.

[0057] Particularly, Figure 9 shows a block diagram of a reproducing apparatus configured such that a normal interactive graphics stream and an on-demand interactive graphics stream use the same buffer memory. Since the two types of interactive graphics streams use the same buffer of the decoder 910 as shown in Figure 9, only one of the normal interactive graphics stream and the on-demand interactive graphics stream can exist in the buffer of the decoder 910 at a given time. That is, only one type of interactive graphics stream can be processed at once.

[0058] Figure 10 is a block diagram of a reproducing apparatus for reproducing an on-demand interactive graphics stream according to another embodiment of the present invention.

[0059] Referring to Figure 10, a reproducing apparatus configured such that a normal interactive graphics stream and an on-demand interactive graphics stream are stored in separate buffer memories is shown. That is, the normal interactive graphics stream is stored in a normal ICS memory area 1010, and the on-demand interactive graphics stream is stored in an on-demand ICS memory area 1020. Therefore, the two types of interactive graphics streams can simultaneously exist in buffers. In this case, when a normal interactive graphics stream is input in a state where an on-demand interactive graphics stream exists in a buffer, or when an on-demand interactive graphics stream is input in a state where a normal interactive graphics stream exists in a buffer, the buffer memory of a decoder does not have to be reset. However, when the two types of interactive graphics streams are simultaneously displayed on a screen, it may not be clear which object a user operation is related to, and adapting color information to a screen configuration can be problematic. Therefore, even though not shown in Figure 10, the reproducing apparatus can further include a control unit selecting the normal interactive graphics stream or the on-demand interactive graphics stream to be output and the respective CULT block for the interactive graphics stream.

[0060] Figure 11 illustrates an interactive graphics stream included in AV data according to an embodiment of the present invention.

[0061] Referring to Figure 11, Figure 11A shows a case where only on-demand interactive graphics streams are recorded in single AV data. Figure 11B shows a case where only normal interactive graphics streams are recorded in single AV data. Figure 11C shows a case where two types of interactive graphics streams are mixed and recorded in single AV data. Figure 11D shows a case where two types of interactive graphics streams are mixed and recorded in single AV data and on-demand interactive graphics streams are separated from the other AV data and recorded. In particular, referring to Figure 11D, when the AV data is read from the beginning, on-demand ICS data recorded at the beginning of the AV data is referred to. However, when the AV data is read from a middle position, since only configuration information is recorded in the AV data while object data of a real button image is separately recorded, the button is output using the separately recorded object data with reference to the configuration information recorded in the AV data. In this case, unnecessary data redundancy can be prevented by separately recording the object data.

[0062] On the basis of the data configurations of an on-demand interactive graphics stream and the configurations of a reproducing apparatus described above, a process of outputting the on-demand interactive graphics stream to a screen according to a user’s activation command will be described.

[0063] Figures 12 and 13 illustrate configurations of player status registers for recording information regarding an interactive graphics stream according to embodiments of the present invention.

[0064] Referring to Figure 12, in a player status register (PSR), a number of an interactive graphics stream being currently reproduced or an interactive graphics stream to be reproduced later is recorded. In Figure 12, the number is recorded in bit0-bit7 of a PSR 0. Therefore, even when reproduction of a multimedia image is temporarily stopped and restarted, an interactive graphics stream that was being reproduced just before can be reproduced again by referring to the PSR 0.

[0065] In a reproducing apparatus supporting both
normal interactive graphics stream and on-demand interactive graphics stream, it must be determined whether a stream number recorded in the PSR 0 is a number indicating the normal interactive graphics stream or the on-demand interactive graphics stream. Therefore, a reproducing apparatus according to an embodiment of the present invention includes an ICS_usage flag for determining whether an interactive graphics stream number recorded in the PSR 0 is a number indicating the normal interactive graphics stream or the on-demand interactive graphics stream. In Figure 12, the ICS_usage flag is recorded in bit30 of the PSR 0. That is, if a stream being currently reproduced is an on-demand interactive graphics stream, the ICS_usage flag is set to 0.

Also, in an on-demand interactive graphics stream, a disp_flag flag is defined to indicate whether the stream is to be displayed on a screen. In Figure 12, the disp_flag flag is recorded in bit31 of the PSR 0. If the disp_flag flag is set to 1, when an on-demand interactive graphics stream is ready to be activated, the reproducing apparatus displays an initial menu page on the screen to inform a user that the on-demand interactive graphics stream is ready to be activated. If the disp_flag flag is set to 0, the reproducing apparatus does not display an interactive graphics on the screen.

On the other hand, when the disp_flag flag is set to 0 and an on-demand interactive graphics stream is ready to be activated, that is, when the on-demand interactive graphics stream is ready to be activated and the on-demand interactive graphics stream is not to be displayed on the screen, there are two methods of processing the on-demand interactive graphics stream. In the first method, the reproducing apparatus is configured such that the on-demand interactive graphics stream is activated when an activation command is generated by a user. In the second method, the reproducing apparatus is configured such that the on-demand interactive graphics stream is not activated and the user’s command is ignored when generated by the user.

Figure 13 illustrates a configuration of a player status register recording information regarding an interactive graphics stream according to another embodiment of the present invention. Referring to Figure 13, a reproducing apparatus configured to record two types of interactive graphics streams in separate PSRs is shown. That is, a case where information regarding a normal interactive graphics stream is recorded in a PSR 0 and information regarding an on-demand interactive graphics stream is recorded in a PSR 11 is shown.

If an ICS_type field indicates a normal interactive graphics stream, information regarding the normal interactive graphics stream is recorded in the PSR 0, and if the ICS_type field indicates an on-demand interactive graphics stream, information regarding the on-demand interactive graphics stream is separately recorded in the PSR 11. Accordingly, unlike the configuration shown in Figure 12, an ICS_usage flag for determining an ICS type of an interactive graphics stream is not required. However, in the PSR 11, it is required that a disp_flag flag indicating whether an initial menu page for informing a user that an on-demand interactive graphics stream is ready to be activated is displayed on a screen, and the operation of the disp_flag flag is the same as Figure 12. In Figure 13, the disp_flag flag is recorded in bit31 of the PSR 11.

Referring to Figure 14, a reproducing apparatus determines whether an on-demand interactive graphics stream is ready to be activated in an interactive graphics decoder, and if the on-demand interactive graphics stream is ready to be activated, the on-demand interactive graphics stream is displayed on a screen, a focus is set to receive a user command, and a button selection from the user is ready to be received. If the on-demand interactive graphics stream is not ready to be activated, an activation command from the user is ignored, or a message informing the user that an on-demand interactive graphics stream to be output does not exist is displayed on the screen.

Figures 15A and 15B show display statuses according to values of a disp_flag flag for the configurations of player status registers shown in Figures 12 and 13, respectively.

Referring to Figure 15A, when a disp_flag flag is set to 1, if an on-demand interactive graphics stream is decoded and ready to be activated, an initial menu page is displayed on a screen informing a user that the on-demand interactive graphics stream is ready to be activated. If an activation command for the on-demand interactive graphics stream is generated by the user, a first menu page is displayed on the screen.

Referring to Figure 15B, when the disp_flag flag is set to 0, the initial menu page is not displayed on the screen even if the on-demand interactive graphics stream is decoded and ready to be activated. However, when an activation command for the on-demand interactive graphics stream is generated by the user, a reproducing apparatus can be configured so that the activation command is ignored or the first menu page is displayed on the screen.

Figure 16 illustrates a system menu of a reproducing apparatus in which menu items for turning an output of an on-demand interactive graphics stream on/off are defined. If a user sets an On-demand ICS Display item on, a disp_flag flag of a status register storing information regarding the on-demand interactive graphics stream, for example, the PSR 0 or the PSR 11 described above, is set to 1. On the other hand, if the user sets the On-demand ICS Display item off, the reproducing apparatus sets the disp_flag flag of the status register as 0. That is, the disp_flag flag can be changed using a user...
interface, which is called the system menu.

[0076] Figure 17 is a schematic diagram of a remote control including a button for turning on or off an on-demand interactive graphics stream. A user can set a disp_flag flag of a status register to 0 or 1 by pushing a relevant button.

[0077] On the basis of the data configurations of an on-demand interactive graphics stream and the configurations of a reproducing apparatus described above, a reproducing method according to an embodiment of the present invention will now be described.

[0078] Figures 18 and 19 are flowcharts illustrating a method of reproducing a storage medium on which an interactive graphics stream is recorded according to an embodiment of the present invention.

[0079] Referring to Figure 18, an interactive graphics stream is read from a storage medium storing normal interactive graphics streams, and/or on-demand interactive graphics streams, in operation 1802. The read interactive graphics stream is checked in operation 1804. The type of the decoded interactive graphics stream is checked in operation 1806. If the decoded interactive graphics stream is a normal interactive graphics stream, the decoded interactive graphics stream is displayed on the screen in operation 1810.

[0080] Referring to Figure 19, if the decoded interactive graphics stream is an on-demand interactive graphics stream, a disp_flag flag indicating whether the on-demand interactive graphics stream is to be displayed on the screen is read from a player status register in operation 1902. If a value of the disp_flag flag is 1 in operation 1904, an initial menu page informing the user that the on-demand interactive graphics stream is ready to be activated is displayed on the screen in operation 1906. If the user inputs an activation command when the output initial menu page is displayed on the screen in operation 1908, a menu page demanding on the user command is generated by a user in operation 1910.

[0081] On the other hand, if the value of the disp_flag flag is 0 in operation 1904, nothing is displayed on the screen, and even if an activation command is generated by the user in operation 1920, the activation command is ignored in operation 1922. Even though it is not shown in Figure 19, if the value of the disp_flag flag is 0, nothing is displayed on the screen, and if an activation command is generated by the user using a user interface such as a remote control, the initial menu page is displayed on the screen.

[0082] By using an on-demand interactive graphics stream according to described embodiments of the present invention, the on-demand interactive graphics stream can be controlled so that it is displayed on and disappears from a screen at designated times or displayed on the screen only if a user generates a command.

[0083] According to the described embodiments of the present invention, an interactive graphics such as a button can be controlled by using an on-demand interactive graphics stream so that the button is displayed on a screen when a user generates a command.

[0084] Also, an interactive graphics stream specialized for a relevant area can be configured by configuring different on-demand interactive graphics streams for certain areas or chapters of AV data. For example, instead of buttons performing fixed functions, information related to actors/actresses, properties, and shooting locations existing in certain areas included in multimedia images can be provided to a user.

[0085] Furthermore, the number of buttons on a remote control can be reduced by configuring functions corresponding to the buttons of the remote control with a menu driven method using an on-demand interactive graphics stream.

[0086] Although a few preferred embodiments have been shown and described, it will be appreciated by those skilled in the art that various changes and modifications might be made without departing from the scope of the invention, as defined in the appended claims.

[0087] Attention is directed to all papers and documents which are filed concurrently with or previous to this specification in connection with this application and which are open to public inspection with this specification, and the contents of all such papers and documents are incorporated herein by reference.

[0088] All of the features disclosed in this specification (including any accompanying claims, abstract and drawings), and/or all of the steps of any method or process so disclosed, may be combined in any combination, except combinations where at least some of such features and/or steps are mutually exclusive.

[0089] Each feature disclosed in this specification (including any accompanying claims, abstract and drawings) may be replaced by alternative features serving the same, equivalent or similar purpose, unless expressly stated otherwise. Thus, unless expressly stated otherwise, each feature disclosed is one example only of a generic series of equivalent or similar features.

[0090] The invention is not restricted to the details of the foregoing embodiment(s). The invention extends to any novel one, or any novel combination, of the features disclosed in this specification (including any accompanying claims, abstract and drawings), or to any novel one, or any novel combination, of the steps of any method or process so disclosed.
Claims

1. A storage medium comprising:

   video data; and

   graphics data for displaying a menu,

   wherein the graphics data includes first graphics data displayed on the screen when an activation command is generated by a user.

2. The storage medium of claim 1, wherein the graphics data also includes second graphics data displayed on the screen at a designated time.

3. The storage medium of claim 2, wherein the first graphics data and the second graphics data have identical or similar structures which include a field for discriminating the first graphics data and the second graphics data.

4. The storage medium of claim 3, wherein the first graphics data and the second graphics data have graphics_segment structures which include segment_type fields (602) defining the type of the first graphics data and the type of the second graphics data, respectively.

5. The storage medium of claim 3, wherein the first graphics data and the second graphics data have interactive_graphic_segment structures which include a type field (702) for discriminating the first graphics data and the second graphics data.

6. The storage medium of claim 2, wherein the first graphics data has an on_demand_interactive_graphic structure different from the structure of the second graphics data.

7. The storage medium of claim 6, wherein the on_demand_interactive_graphic structure includes information regarding an initial menu page indicating that the first graphics data is decoded and ready to be displayed and information regarding at least one menu page to be displayed when an activation command is generated by the user.

8. The storage medium of claim 7, wherein each menu page includes information for displaying at least one button and information regarding a command to be performed when the user selects the button.

9. The storage medium of claim 1, wherein the first graphics data is multiplexed with the video data and recorded in a single stream.

10. The storage medium of claim 2, wherein the first graphics data and the second graphics data are multiplexed with the video data and recorded in a single stream.

11. The storage medium of claim 2, wherein the first graphics data and the second graphics data are multiplexed with the video data and recorded in a single stream, and object data used by the first graphics data indicates an image of the menu screen and is included in an independent stream.

12. A reproducing apparatus for reproducing from a storage medium video data and graphics data for displaying a menu, comprising:

   a video decoder (230) which decodes video data; and

   a graphics decoder (910) which decodes graphics data,

   wherein the graphics decoder (910) decodes first graphics data displayed when the graphics data is of a specified type and an activation command is received, and

   wherein second graphics data is displayed at a designated time when the graphics data is not of the first type.

13. The apparatus of claim 12, further comprising:

   a blender overlaying the decoded video data and the decoded graphics data; and

   an interface transmitting a user command to the graphics decoder (910).

14. The apparatus of claim 12, wherein the graphics decoder (910) decodes the first graphics data and the second graphics data using a buffer (916) and decodes only one of the first graphics data and the second graphics data at a specified time.

15. The apparatus of claim 13, wherein the graphics decoder (910) has a buffer (1020) for the first graphics data and a second buffer (1010) for the second graphics data, and the first graphics data and the second graphics data are simultaneously decoded by the graphics decoder (910),

   wherein, when only the first graphics data is displayed on the screen, a focus is set to an interface for the first graphics data, and

   wherein, when only the second graphics data is displayed on the screen, the focus is set to an interface for the second graphics data.

16. The apparatus of any of claims 12 to 15, wherein the interface transmits an activation command from
the user within a specified period when the video data and graphics data are multiplexed and recorded as a single stream, and

wherein the graphics decoder (910) deletes information stored in all buffers in the graphics decoder (910) when the specified period elapses.

17. The apparatus of claim 16, wherein the specified period begins at a presentation time indicated by packet header information if the graphics data is an MPEG standard transport stream and ends at an output finish time indicated by the first graphics data or the second graphics data, or at a start time of a subsequent display set included in the first graphics data or the second graphics data.

18. The apparatus of claim 12, wherein, when the video data and graphics data are multiplexed and recorded as separate streams, the graphics data is preloaded in a buffer of the graphics decoder (910).

19. The apparatus of any of claims 12 to 18, wherein the graphics decoder (910) includes:

- a status register which stores a stream number of the first graphics data or the second graphics data that is being reproduced or will be reproduced, the status register having a flag discriminating the first graphics data and the second graphics data and a flag indicating whether decoded first graphics data is to be displayed.

20. The apparatus of any of claims 12 to 18, wherein the graphics decoder (910) includes:

- status registers which store stream numbers of the first graphics data and the second graphics data that are being reproduced or will be reproduced, respectively, and

- wherein the status register for the first graphics data includes a flag indicating whether decoded first graphics data is to be displayed on the screen.

21. The apparatus of claim 19, wherein the graphics decoder (910) displays an initial menu page indicating that the first graphics data is decoded and ready to be displayed on the screen.

22. The apparatus of claim 21, wherein, when an activation command is input by the user when the flag is set so that the first graphics data is not to be displayed, the graphics decoder (910) ignores the activation command from the user or displays the initial menu page.

23. The apparatus of claim 19, wherein the interface comprises:

- a system menu turning on/off a value of the flag indicating whether the first graphics data is displayed on the screen.

24. The apparatus of claim 19, wherein the interface includes a remote control having a button for turning on/off a value of the flag indicating whether the first graphics data is displayed on the screen.

25. A reproducing method of reproducing from a storage video data and graphics data for displaying a menu screen, comprising:

- decoding graphics data; and
- outputting, on the basis of the decoded graphics data, the decoded graphics data when an activation command is generated by a user or displaying the decoded graphics data at a designated time.

26. A method of reproducing an interactive graphics stream from a storage medium, comprising:

- reading an interactive graphics stream from the storage medium;
- decoding the read interactive graphics stream;
- determining a type of the read interactive graphics stream; and
- blending the decoded interactive graphics stream with video data and one of displaying the blended data at a designated time when the decoded interactive graphics stream is a normal interactive graphics stream and displaying the blended data when an activation command is received when the decoded interactive graphics stream is an on-demand interactive graphics stream.

27. The method of claim 26, wherein, when the decoded interactive graphics stream is an on-demand interactive graphics stream, the blending includes:

- reading a disp_flag flag indicating whether the on-demand interactive graphics stream is to be displayed from a player status register;
- displaying, when a value of the disp_flag flag is a first value, an initial menu page indicating that the on-demand interactive graphics stream is
ready to be activated;

displaying a menu page according to a user command, when an activation command is received during display of the initial menu page; and

ignoring an activation command when the value of the disp_flag flag is a second value different from the first value.

28. The method of claim 27, wherein, when an activation command is received from a user interface such as a remote control, the initial menu page is displayed.

29. The method of claim 26, wherein the determining includes analyzing a segment_type field (602) of an ICS.

30. The method of claim 29, wherein the segment_type field (602) indicates a segment type and is located in a segment_descriptor field.

31. The method of claim 30, wherein the segment_type field (602) is defined such that a normal interactive graphics stream type has a value 0x18 and an on-demand interactive graphics stream type has a value 0x19.

32. The method of claim 26, wherein the normal interactive graphics stream and the on-demand interactive graphics stream have the same structure.

33. The method of claim 26, wherein the determining includes analyzing an ICS_type field of the ICS.

34. The method of claim 33, wherein the ICS_type field is defined so that, when a value of ICS_type is a first value, a normal interactive graphics stream is indicated, and when a value of ICS_type is a second value different from the first, an on-demand interactive graphics stream is indicated.

35. The method of claim 26, wherein the determining includes analyzing a structure of the interactive graphics stream.

36. The method of claim 35, wherein a structure of the normal interactive graphics stream and an on-demand interactive graphics stream differ.

37. The method of claim 36, wherein the structure of the on-demand interactive graphics stream defines first through nth menu pages.

38. The method of claim 37, wherein at least one of the menu pages is an initial menu page including an initial button indicating that the on-demand interactive graphics stream is decoded and is ready to be activated, and wherein another of the menu pages includes a button to be displayed after the on-demand interactive graphics stream is activated.

39. An interactive graphics decoder, comprising:

a stream graphics processor (914) which decodes a received interactive graphic stream and transmits button image object data and button configuration information after the decoding;

a coding data buffer (912) which temporarily stores an interactive graphics stream and then transmits the interactive graphics stream to a stream graphics processor (914);

an object buffer (916) which receives the button image object data;

a composition buffer (918) which receives the button configuration information; and

a graphics controller (920) which builds an image to be displayed using data stored in the object buffer and the composition buffer (918) and transmits the determined image from the object buffer to a graphics plane (930).

40. The decoder of claim 39, wherein the built image includes first graphics data when the interactive graphics stream is of a specified type and an activation command is received, and wherein the built image includes second graphics data when the interactive graphics stream is not of the first type.

41. The decoder of claim 39 or 40, wherein the graphics controller (920) changes a button state in response to a user command and adapts this result to an output.
