Notice of opposition shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

Description

[Field of the Invention]

[0001] The present invention relates to a curved-surface display panel fabrication method for fabricating a display panel having a curved surface using a flat display panel. The features of the preamble of the independent claims are known from JP 2010 097 028 A. Related technologies are known from US 2009/161048 A1, US 2009/284904 A1 and US 2009/015747 A1.

[Background Art]

[0002] Various display devices have been developed and are being used. A liquid crystal display device which realizes images using liquid crystal is widely used.

[0003] Generally, a liquid crystal display (LCD) includes two display panels and a liquid crystal layer disposed therebetween and having a dielectric anisotropy. An electric field is formed in the liquid crystal layer, and a transmittance of light passing the liquid crystal layer is regulated by regulating amplitude of the electric field so as to obtain a desired image. Such a liquid crystal display is representative one of a flat panel display (FPD), and TFT-LCD which uses thin film transistor (TFT) as a switching element is widely used.

[0004] A plurality of display signal lines i.e., gate lines and data lines, a plurality of thin film transistors and pixel electrodes are formed on a lower display panel of the two display panels of the liquid crystal display panel, and a color filter and a common electrode are formed on a upper display panel.

[0005] Such a liquid crystal display panel is generally manufactured in a flat shape, so the conventional liquid crystal display panel cannot be used as a curved display.

[0006] In order to solve this problem, a flexible liquid crystal display panel which has flexible substrates instead of glass substrates of a conventional liquid crystal display panel so as to be bent by external bending force has been developed.

[0007] However, there is a problem that the manufacturing process of the conventional flexible liquid crystal display panel is difficult and the manufacturing cost thereof is high.

[Detailed Description of the Invention]

[Technical Problem]

[0008] The present invention has been made in an effort to provide a curved-surface display panel fabrication method which can produce a display panel having a curved shape through a simple process using a conventional flat display panel.

[Technical Solution]

[0009] The present invention is defined in the independent claims.

[Advantageous Effects]

[0010] According to the present invention, outer surfaces of the first substrate and the second substrate of a conventional flat display panel are partially removed to reduce the thicknesses thereof and then a reinforcing plate is attached in a state that the display panel is bent to maintain the curved shape, so the curved display panel can be fabricated through simple process.

[Brief Description of Drawings]

[0011]

FIG. 1 is a schematic perspective view of a curved display panel formed by a curved-surface display panel fabrication method according to an example useful for understanding the present invention.

FIG. 2 is a cross sectional view taken along a line II-II in FIG. 1.

FIG. 3 is a cross sectional view taken along a line III-III in FIG. 1.

FIG. 4 is a drawing for explaining a process of partially removing outer surfaces of a flat display panel.

FIG. 5 is a drawing for explaining a process of attaching polarizers at outer surfaces of a display panel.

FIG. 6 is a drawing for explaining a process of forming adhesive layers on outer surfaces of a display panel.

FIG. 7 is a drawing for explaining a process of attaching reinforcing plates on outer surfaces of a display panel, wherein the process of FIG. 7 is used in a curved-surface display panel fabrication method according to the present invention.

FIG. 8 is a sectional view of a curved-surface display panel which is formed by a curved-surface display panel fabrication method that does not fall under the scope of the claims.

FIG. 9 is a drawing for explaining a process of attaching reinforcing strips used in a curved-surface display panel fabrication method according to the present invention.

[Detailed Description of the Embodiments]

[0012] The present invention will now be described hereinafter with reference to the accompanying drawings.

[0013] A curved-surface display panel fabrication method according to the present invention relates to a method which forms a display panel having a desired curved shape using a conventional flat display panel hav-

ing two substrates facing one another. For example, the display panel having a desired curved shape can be fabricated from a liquid crystal display panel which includes two substrates facing one another and a liquid crystal layer formed therebetween. A method for fabricating a curved-surface display using a liquid crystal display panel will be explained.

[0014] As shown in FIG. 1 to FIG. 7, which illustrate examples useful for understanding the present invention, the method for fabricating a curved-surface display panel according to the present invention forms a display panel having a desired curved shape using a flat display panel 100a (referring to FIG. 4) having a first substrate 110 and a second substrate 120 facing each other and a liquid crystal layer 130 having liquid crystals aligned in a vertical or parallel direction with respect to the two substrates 110 and 120.

[0015] The first substrate 100 may be referred to as a thin film transistor array substrate, and the second substrate 120 may be referred to as a color filter array substrate.

[0016] Meanwhile, not shown in the drawing, at edges of the two substrates 110 and 120, a sealant which is made of material for bonding the two substrates 110 and 120 and forms a space which is filled with liquid crystal may be disposed, and the liquid crystal is prevented from being leaked by the sealant.

[0017] The method for fabricating a curved-surface display panel according to the present invention includes paring partially outer portions of the first substrate 110 and the second substrate 120 respectively so as to reduce thicknesses thereof to predetermined thicknesses. That is, as shown in (a) of FIG. 4, by removing outer surfaces of the first substrate 100 and the second substrate 120 of the conventional flat type liquid crystal display panel 100a, a shape of (b) of FIG. 4 is obtained.

[0018] At this time, in the step of paring outer portions ((a) to (b) in FIG. 4), a method of paring the first substrate 110 and the second substrate 120 may be any one of methods known in the art. For example, it may be a mechanical polishing method or an etching method using etchant.

[0019] When the outer portion of the first substrate 110 and the second substrate 120 are pared, edge portions which are not bent in the desired curved shape are not removed. That is, as shown in (b) of FIG. 4, the upper and lower portions of the first substrate 110 and the second substrate 120 are not pared. This protects the driving circuits such as PCB(Printed Circuit Board) to which a driver for driving the liquid crystal panel and various circuit elements are connected may be connected to the upper and lower edges of the substrates. In addition, not paring the upper and lower edges of the substrates, the upper and lower edge portions play a role of a guide for members which will be attached in the subsequent processes, and play a role of enhancing the structural strength of the curved-surface display panel.

[0020] The desired curved shape may be a round

bracket or a curve shape without an inflection point as shown in FIG. 1 to FIG. 3, and may be an S-shaped curve or a curve shape having one or more inflection points. That is, the desired curved shape may be variously altered.

[0021] Further, in the paring step (from (a) to (b) of FIG. 4), the predetermined thickness may be within a range of 50 to 150 μm . If the thicknesses of the first substrate 110 and the second substrate 120 after being pared is less than 50 μm or greater than 200 μm , they may be broken during being bent or may be difficult to be bent. That is, since the thickness of the first substrate 110 and the second substrate 120 after being pared is between 50 to 150 μm , the first substrate 110 and the second substrate 120 can be bent without being broken.

[0022] Meanwhile, the method for fabricating a curved-surface display panel according to the present invention may further include the step of attaching one or more polarizers 170 on at least one of the pared outer surfaces of the first substrate 110 and the second substrate 120. At this time, the polarizer 170 may be attached in a state that the first substrate 110 and the second substrate 120 are bent to have the desired curved shape.

[0023] As shown in FIG. 2, FIG. 3 and FIG. 5, the polarizer 170 can be attached to the pared outer surfaces of the first substrate 110 and the second substrate 120 respectively, but can be attached to only one of the outer surfaces of the first substrate 110 and the second substrate 120.

[0024] Meanwhile, the polarizer 170 may also be attached to the outer surface of reinforcing plates 140 and 150, which will be described later, instead of the outer surfaces of the first substrate 110 and the second substrate 120.

[0025] In addition, the method for fabricating a curved-surface display panel according to an embodiment of the present invention includes attaching reinforcing plates 140 and 150 with light transparent characteristics having the same shape with the desired curved surface to the display panel 100a using adhesive layers 191 and 193 which are formed at least on a portion of the edge areas of the display panel 100a. At this time, although the adhesive layers 191 and 193 and the reinforcing plates 140 and 150 are provided respectively on both outer surfaces of the first substrate 110 and the second substrate 120, the adhesive layers 191 and 193 and the reinforcing plates 140 and 150 may be provided on only one of the outer surfaces of the first substrate 110 and the second substrate 120. For example, the adhesive layer and the reinforcing plate may be provided only on a front surface of the second substrate 120 which is closer to a person who sees a display screen among the first substrate 110 and the second substrate 120.

[0026] For example, referring to FIG. 6, the adhesive layers 191 and 193 may be formed in a closed figure (e.g., a rectangular loop shape in the drawing) along edges of the pared outer surfaces of the first substrate 110 and the second substrate 120. In more detail, as shown

in FIG. 6, the adhesive layers 191 and 193 may be formed in a closed figure having a predetermined width and having a dam shape along edges of the pared portions among the outer surfaces of the first substrate 110 and the second substrate 120. At this time, referring to FIG. 1 and FIG. 3, the adhesive layers 191 and 193 may be formed to be of the same height with the non-pared portion of the outer surfaces of the first substrate 110 and the second substrate 120 or to be slightly higher than the non-pared portion of the outer surfaces of the first substrate 110 and the second substrate 120, so the reinforcing plates 140 and 150 can contact the adhesive layers 191 and 193 to be adhered thereto.

[0027] For example, the adhesive layers 191 and 193 may be formed with OCA (optically clear adhesive).

[0028] Further, referring to FIG. 7, the reinforcing plates 140 and 150 are adhered to the adhesive layers 191 and 193 which are formed along edges of the outer surfaces of the first substrate 110 and the second substrate in a state that the display panel 100a is bent in a desired curved surface, so as to be attached to the display panel.

[0029] The reinforcing plates 140 and 150 may be formed of material having good light transmitting characteristics, for example materials such as glass or PMMA(PolyMethyl MethAcrylate). At this time, the reinforcing plates 140 and 150 have the same curved shape with the desired curved shape of the curved-surface display panel, and may have strength to maintain the curved shape. As such, after paring outer surfaces of the conventional flat liquid crystal display panel to be flexible and bending the same in a desired curve shape, by attaching the reinforcing plates 140 and 150 having the same curve shape onto the outer surfaces of the bent liquid crystal panel 100a, the curved-surface display panel having the desired curved shape can be formed.

[0030] In the fabrication method according to the invention the reinforcing plates 140 and 150 are attached to the display panel 100a by the adhesive layers 191 and 193 in a state of being spaced from the pared outer surfaces of the first substrate 110 and the second substrate 120. That is, referring to FIG. 3, empty spaces are formed between the reinforcing plates 140 and 150 and the pared outer surfaces of the first substrate 110 and the second substrate 120 so as to form an air gap therebetween. With the existence of the air gap therebetween, the weight of the curved-surface display panel can be reduced and further a shock absorbing effect to protect the first substrate 110 and the second substrate 120 from external shock can be obtained.

[0031] Meanwhile, not shown in the drawing, an anti-reflective coating may be formed on an outer surface of the reinforcing plate 150 to improve the display characteristics.

[0032] FIG. 8 is a sectional view of a curved-surface display panel which is formed by a curved-surface display panel fabrication method not falling under the scope of the present invention.

[0033] In the method according to the invention an empty space is formed between the reinforcing plates 140 and 150 and the first and second substrates 110 and 120; in the method of Fig. 8 not falling under the invention, 5 a reinforcing layer 200 with light transmitting characteristics is formed in a space between the reinforcing plates 140 and 150 and the first and second substrates 110 and 120.

[0034] For example, the reinforcing layer 200 with light 10 transmitting characteristics may be formed by filling OCA(optically clear adhesive) within the space between the reinforcing plates 140 and 150 and the first and second substrates 110 and 120.

[0035] The reinforcing plates 140 and 150 and the first 15 and second substrates 110 and 120 can be firmly attached to one another by the reinforcing layer 200 which is formed therebetween, and the overall strength of the curved-surface display panel can be enhanced.

[0036] Hereinafter, referring to FIG. 9, a process of attaching reinforcing strips used in the method for fabricating a curved-surface display panel according to a process of attaching reinforcing strips used in the the present invention will be explained.

[0037] In a state that the first and second substrates 25 110 and 120 are pared and are then bent, before forming the adhesive layers 191 and 193 and attaching the reinforcing plates 140 and 150 using the same, reinforcing strips 310 and 320 are formed along the curved edges of the first and second substrates 110 and 120. At this 30 time, the edge portions of the outer surfaces of the first and second substrates 110 and 120 which will be bent are fully pared to the outer ends thereof.

[0038] That is, referring to FIG. 9, the edge portions (i.e., left and right edge portions in the drawing) of the 35 first and second substrates 110 and 120 which are bent are fully pared to the outer ends thereof, and the reinforcing strips 310 and 320 having a predetermined width and height are formed in a state that the first and second substrates 110 and 120 are bent. For example, the width 40 of the reinforcing strips 310 and 320 can be determined suitably with consideration of the display area, and the thickness of the reinforcing strips 310 and 320 can be set such that the height of the upper surface thereof is equal to the outer surfaces of the first and second substrates 110 and 120 before being pared or slightly lower than the same.

[0039] At this time, the reinforcing strips 310 and 320 may be formed by curing UV(ultraviolet) ray curing resin.

[0040] Meanwhile, although it is shown in FIG. 9 that 50 the reinforcing strips 310 and 320 are formed on the polarizers 170 in a state that the polarizers 170 are attached to the first and second substrates 110 and 120, in case that the polarizers 170 are omitted, the reinforcing strips 310 and 320 may be attached directly on the first and 55 second substrates 110 and 120. In addition, although it is shown that the reinforcing strips 310 and 320 are formed on both outer surfaces of the first and second substrates 110 and 120, the reinforcing strip may be

formed on only one of the outer surfaces of the first and second substrates 110 and 120.

[0041] As such, by forming the reinforcing strips 310 and 320, the structural strength of the edge portion which is pared to the outer end thereof and is bent can be substantially increased.

[Industrial Applicability]

[0042] The present invention relates to a display fabrication method and can be applied to a fabrication method of various display devices such as a curved-surface LCD, so that present invention has an industrial applicability.

Claims

1. A method for fabricating a curved display panel (100) having a desired curved shape, the method comprising the steps of providing a flat display panel (100a) having a first substrate (110) and a second substrate (120); partially paring outer surfaces of the first substrate (110) and the second substrate (120) so as to reduce thicknesses of each substrate to a predetermined thickness; and bending the flat display panel (100a) to the desired curved shape, thereby obtaining a bent display panel having bent substrate edges; wherein, in the step of paring the outer surfaces of the first substrate (110) and the second substrate (120), the substrate edges to be bent to the curved shape are partially pared to their ends, so as to not remove the substrate edges that are not bent, thereby forming bent edge portions, the method being characterized by comprising a step of attaching reinforcing plates (140, 150) having the same shape with the desired curved shape and possessing light transmitting characteristics to the bent display panel by using an adhesive layer (191, 193) which is formed on at least a part of edge portions of the display panel, wherein the reinforcing plates (140, 150) are attached to the display panel by the adhesive layer (191, 193) so as to be spaced from the pared outer surfaces of the first substrate (110) and the second substrate (120) through an empty space, and wherein the method further comprises a step of forming a reinforcing strip (310, 320) along one or both bent edge portions of the bent display panel before the step of attaching the reinforcing plate (140, 150) to the display panel.
2. The curved-surface display panel fabrication method of claim 1, wherein the adhesive layer (191, 193) is formed along edges of the display panel in a shape of a closed figure.

3. The curved-surface display panel fabrication method of claim 1 or claim 2, the adhesive layer (191, 193) is formed of optically clear adhesive.

- 5 4. The curved-surface display panel fabrication method of claim 1, further comprising attaching a polarizer (170) on one or more of the pared outer surfaces of the first substrate (110) and the second substrate (120).
- 10 5. The curved-surface display panel fabrication method of claim 1, the reinforcing strip (310, 320) is formed by curing an ultraviolet ray curing resin.
- 15 6. A curved-surface display panel (100) having a desired curved shape, the curved-surface display panel (100) being formed using a flat display panel (100a) having a first substrate (110) and a second substrate (120), and comprising:

the first substrate (110) and the second substrate (120), outer surfaces of which are partially pared and bent to the desired curved surface, such that the display panel has bent substrate edges, wherein the substrate edges bent to the desired curved shape are partially pared to their ends, such that the display panel has bent substrate edges,

characterized by

a reinforcing plate (140, 150) having the same desired curved shape and possessing light transmitting characteristics, the reinforcing plate (140, 150) being attached to the bent display panel having the desired curved shape by an adhesive layer (191, 193) which is formed on at least a part of edge portions of the display panel, wherein the reinforcing plate (140, 150) is spaced from the pared outer surfaces of the first substrate (110) and the second substrate (120) through an empty space, and wherein the curved-surface display panel (100) further comprises a reinforcing strip (310, 320) formed along one or both bent edge portions of the display panel.

7. The curved-surface display panel of claim 6, wherein the adhesive layer (191, 193) is formed on at least a portion of edge portions of the first substrate (110) and the second substrate (120).
- 50 8. The curved-surface display panel of claim 7, wherein the adhesive layer (191, 193) is formed along edges of the first substrate (110) and the second substrate (120) in a shape of a closed figure.

Patentansprüche

1. Verfahren zum Herstellen eines gekrümmten Anzeigeelements (100) mit einer gewünschten gekrümmten Form, wobei das Verfahren die Schritte umfasst, dass
 ein flaches Anzeigeelement (100a) mit einem ersten Substrat (110) und einem zweiten Substrat (120) bereitgestellt wird;
 äußere Flächen des ersten Substrats (110) und des zweiten Substrats (120) teilweise abgetragen werden, um die Dicken jedes Substrats auf eine vorbestimmte Dicke zu reduzieren; und
 das flache Anzeigeelement (100a) in die gewünschte gekrümmte Form gebogen wird, wodurch ein gebogenes Anzeigeelement mit gebogenen Substraträndern erhalten wird;
 wobei die in die gekrümmte Form zu biegenden Substratränder in dem Schritt des Abtragens der äußeren Flächen des ersten Substrats (110) und des zweiten Substrats (120) teilweise bis zu ihren Enden abgetragen werden, um die Substratränder, die nicht gebogen werden, nicht zu entfernen, wodurch gebogene Randabschnitte ausgebildet werden,
 wobei das Verfahren
dadurch gekennzeichnet ist, dass es einen Schritt des Anbringens von Verstärkungsplatten (140, 150), die die gleiche Form aufweisen wie die gewünschte gekrümmte Form und Lichttransmissionseigenschaften besitzen, an dem gebogenen Anzeigeelement durch Verwenden einer haftenden Schicht (191, 193), die an zumindest einem Teil von Randabschnitten des Anzeigeelements ausgebildet wird, umfasst,
 wobei die Verstärkungsplatten (140, 150) durch die haftende Schicht (191, 193) derart an dem Anzeigeelement angebracht werden, dass sie von den abgetragenen äußeren Flächen des ersten Substrats (110) und des zweiten Substrats (120) durch einen leeren Raum beabstandet sind, und
 wobei das Verfahren ferner einen Schritt des Ausbildens eines Verstärkungsstreifens (310, 320) entlang eines oder beider gebogener Randabschnitte des gebogenen Anzeigeelements vor dem Schritt des Anbringens der Verstärkungsplatte (140, 150) an dem Anzeigeelement umfasst.
2. Herstellungsverfahren eines Anzeigeelements mit gekrümmter Fläche nach Anspruch 1,
 wobei die haftende Schicht (191, 193) entlang Rändern des Anzeigeelements in Form einer geschlossenen Figur ausgebildet wird.
3. Herstellungsverfahren eines Anzeigeelements mit gekrümmter Fläche nach Anspruch 1 oder 2,
 wobei die haftende Schicht (191, 193) aus optisch klarem Klebstoff ausgebildet wird.
4. Herstellungsverfahren eines Anzeigeelements mit gekrümmter Fläche nach Anspruch 1,
 ferner umfassend, dass ein Polarisator (170) an einer oder mehreren der abgetragenen äußeren Flächen des ersten Substrats (110) und des zweiten Substrats (120) angebracht wird.
5. Herstellungsverfahren eines Anzeigeelements mit gekrümmter Fläche nach Anspruch 1,
 wobei der Verstärkungsstreifen (310, 320) durch Aushärten eines mittels Ultraviolettsstrahl aushärtenden Harzes ausgebildet wird.
6. Anzeigeelement (100) mit gekrümmter Fläche mit einer gewünschten gekrümmten Form, wobei das Anzeigeelement (100) mit gekrümmter Fläche unter Verwendung eines flachen Anzeigeelements (100a) mit einem ersten Substrat (110) und einem zweiten Substrat (120) ausgebildet ist, und umfassend, dass:
 bei dem ersten Substrat (110) und dem zweiten Substrat (120) äußere Flächen teilweise abgetragen sind und diese zu der gewünschten gekrümmten Fläche gebogen sind, sodass das Anzeigeelement gebogene Substratränder aufweist,
 wobei die in die gewünschte gekrümmte Form gebogenen Substratränder teilweise bis zu ihren Enden abgetragen sind, um die Substratränder, die nicht gebogen sind, nicht zu entfernen, sodass die gebogenen Substratränder gebogene Randabschnitte aufweisen,
- gekennzeichnet durch**
- eine Verstärkungsplatte (140, 150), die die gleiche gewünschte gekrümmte Form aufweist und Lichttransmissionseigenschaften besitzt, wobei die Verstärkungsplatte (140, 150) **durch** eine haftende Schicht (191, 193), die an zumindest einem Teil von Randabschnitten des Anzeigeelements ausgebildet ist, an dem gebogenen Anzeigeelement mit der gewünschten gekrümmten Form angebracht ist,
 wobei die Verstärkungsplatte (140, 150) von den abgetragenen äußeren Flächen des ersten Substrats (110) und des zweiten Substrats (120) **durch** einen leeren Raum beabstandet ist, und wobei das Anzeigeelement (100) mit gekrümmter Fläche ferner einen Verstärkungsstreifen (310, 320) umfasst, der entlang eines oder beider gebogener Randabschnitte des Anzeigeelements ausgebildet ist.
7. Anzeigeelement mit gekrümmter Fläche nach Anspruch 6,
 wobei die haftende Schicht (191, 193) an zumindest einem Abschnitt von Randabschnitten des ersten

Substrats (110) und des zweiten Substrats (120) ausgebildet ist.

8. Anzeigeelement mit gekrümmter Fläche nach Anspruch 7,
wobei die haftende Schicht (191, 193) entlang Rändern des ersten Substrats (110) und des zweiten Substrats (120) in Form einer geschlossenen Figur ausgebildet ist.

Revendications

1. Procédé pour fabriquer un panneau d'affichage incurvé (100) ayant une forme incurvée désirée, le procédé comprenant les étapes consistant à fournir un panneau d'affichage plat (100a) ayant un premier substrat (110) et un second substrat (120) ; apparié partiellement des surfaces extérieures du premier substrat (110) et du second substrat (120) de manière à réduire les épaisseurs de chaque substrat à une épaisseur pré-déterminée ; et cintrer le panneau d'affichage plat (100a) à la forme incurvée désirée, en obtenant ainsi un panneau d'affichage cintré ayant des bordures de substrat cintrées,
dans lequel, dans l'étape consistant à apparié les surfaces extérieures du premier substrat (110) et du second substrat (120), les bordures de substrat à cintrer à la forme incurvée sont partiellement appariées à leurs extrémités de manière à ne pas supprimer les bordures de substrat qui ne sont pas cintrées, en formant ainsi des portions de bordure cintrées,
le procédé étant **caractérisé en ce qu'il comprend** une étape consistant à attacher des plaques de renforcement (140, 150) ayant la même forme que la forme incurvée désirée et possédant des caractéristiques de transmission de lumière au panneau d'affichage cintré en utilisant une couche adhésive (191, 193) qui est formée sur au moins une partie des portions de bordure du panneau d'affichage,
dans lequel les plaques de renforcement (140, 150) sont attachées au panneau d'affichage par la couche adhésive (191, 193) de manière à être espacées des surfaces extérieures appariées du premier substrat (110) et du second substrat (120) par un espace vide, et
dans lequel le procédé comprend en outre une étape consistant à former un ruban de renforcement (310, 320) le long de l'une ou des deux portions de bordure cintrées du panneau d'affichage cintré avant l'étape consistant à attacher la plaque de renforcement (140, 150) au panneau d'affichage.

2. Procédé de fabrication de panneau d'affichage à surface incurvée selon la revendication 1, dans lequel la couche adhésive (191, 193) est formée le long de

bordures du panneau d'affichage sous la forme d'une figure fermée.

3. Procédé de fabrication de panneau d'affichage à surface incurvée selon la revendication 1 ou 2, dans lequel la couche adhésive (191, 193) est formée d'un adhésif optiquement clair.
4. Procédé de fabrication de panneau d'affichage à surface incurvée selon la revendication 1, comprenant en outre l'étape consistant à attacher un polariseur (170) sur une ou plusieurs des surfaces extérieures appariées du premier substrat (110) et du second substrat (120).
5. Procédé de fabrication de panneau d'affichage à surface incurvée selon la revendication 1, dans lequel le ruban de renforcement (310, 320) est formé en faisant durcir une résine durcissant aux rayons ultraviolets.
6. Panneau d'affichage à surface incurvée (100) ayant une forme incurvée désirée, le panneau d'affichage à surface incurvée (100) étant formé en utilisant un panneau d'affichage plat (100a) ayant un premier substrat (110) et un second substrat (120), et comprenant :
le premier substrat (110) et le second substrat (120), dont des surfaces extérieures sont partiellement appariées et cintrées à la surface incurvée désirée de sorte que le panneau d'affichage a des bordures de substrat cintrées, dans lequel les bordures de substrat cintrées à la forme incurvée désirée sont partiellement appariées à leurs extrémités, de manière à ne pas supprimer les bordures du substrat qui ne sont pas cintrées, de sorte que les bordures de substrat cintrées ont des portions de bordure cintrées,
- caractérisé par**
une plaque de renforcement (140, 150) ayant la même forme incurvée désirée et possédant des caractéristiques de transmission de lumière, la plaque de renforcement (140, 150) étant attachée au panneau d'affichage cintré ayant la forme incurvée désirée par une couche adhésive (191, 193) qui est formée sur au moins une partie des portions de bordure du panneau d'affichage,
dans lequel la plaque de renforcement (140, 150) est espacée des surfaces extérieures appariées du premier substrat (110) et du second substrat (120) par un espace vide, et
dans lequel le panneau d'affichage à surface incurvée (100) comprend en outre un ruban de

renforcement (310, 320) formé le long d'une ou des deux portions de bordure cintrees du panneau d'affichage.

7. Panneau d'affichage à surface incurvée selon la revendication 6, dans lequel la couche adhésive (191, 193) est formée sur au moins une portion des portions de bordure du premier substrat (110) et du second substrat (120). 5

8. Panneau d'affichage à surface incurvée selon la revendication 7, dans lequel la couche adhésive (191, 193) est formée le long de bordures du premier substrat (110) et du second substrat (120) sous la forme d'une figure fermée. 10
