⑤④ **Building elements and method of constructing a building.**

⑤⑦ A moulded building sheet (1) has opposed side edges (5) of increased thickness with respect to the general thickness of the sheet. The thicker side edges each accommodate a rebate (6) which extends along the respective side edge and into which the free ends of reinforcing wires (7) project. The rebates (6) and projecting portions of the wires (7) together form means for joining adjacent sheets together, the wires of one sheet being twisted into engagement with the wires of another sheet. Preferably two building sheets (1) are joined together by spacers (8, 11) to form a composite building panel.
