54 **Device and relevant complementary elements for the suspension of furniture articles to wall wood coverings composed of side-by-side panels.**

57 This device is constituted by a block (7), substantially parallelepiped and made of plastic material, which extends vertically and presents transversally a width sufficient to penetrate in the slit (3) between two side-by-side panels. The device, moreover, presents in the rear part two opposing complanar wings (8, 9) projecting toward the outside, intended to rest against the rear borders of the side-by-side panels (2). Finally, the device presents in the front part a threaded hole (10) for the engagement of a screw, above and below which two projections (11, 12) extend toward the front.

Each complementary element, independently from its shape and main purpose, is characterized by having: a wall (16, 22, 34) which presses against the external surface of the side-by-side panels under the tightening action of a blocking screw (17, 27, 37) so as to vice, between itself and the rear wings of the device, the thickness of the panels, thus forming sort of a clamp which makes the coupling stable; by having two notches (28, 29), or seats, suitable to receive the above-mentioned projections (11, 12) of the device itself.
