⑥④ **Rotary cutter heads.**

⑥⑦ In rotary cutter block (10) a blade (14) is clamped in an inwardly divergent recess (12) by a wedge (18). Springs means (32) in a housing (30) in the wedge (18) takes up any slack when the wedge (18) is loosened, which removes the need for operator manipulation of the wedge (18), blade (14) and optional backing plate (16) for the blade (14) during setting. Also provided is a cam means (40) for incrementally adjusting the blade (14) outwardly of the cutter block (10).
