(54) Shaving apparatus.

(57) A shaving apparatus comprises a rotatably drivable first cutting member (1) having a central part (9) which carries cutters (6) each formed substantially by a cutter blade (7) at one end of a cutter arm (8) which extends at least partly in a radial direction with respect to the axis of rotation of the first cutting member (1) and the other end of which is connected to the central part (9). The first cutting member (1) cooperates with a second cutting member (3) having a wall which comprises hair-entry apertures (5) and over which the cutter blades are movable. Each cutter arm (8) or the part thereof which extends in a radial direction is constructed as a leaf spring which is substantially in a plane which is inclined with respect to the axis of rotation so that in the direction of width the arm or said part thereof extends substantially according to a helical line which extends both in the axial direction towards the second cutting member (3) and in the direction of rotation (P).

CATEGORY OF CITED DOCUMENTS			
X : particularly relevant if taken alone	T : theory or principle underlying the invention		
Y : particularly relevant if combined with another document of the same category	E : earlier patent document, but published on, or after the filing date		
A : technological background	D : document cited in the application		
O : non-written disclosure	L : document cited for other reasons		
P : intermediate document	& : member of the same patent family, corresponding document
