⑤④ **Structural members for supporting panels.**

⑤⑦ A structural member forming a patent glazing bar comprises two identical elements extruded from aluminium. Each element comprises a channel formed by side walls (12) and a base (11), and the side walls of the two elements serve to grip the margins of single or double glazing panels (24). Between the side walls, two limbs (14, 15) each with a serrated face extend into overlapping contact with the respective limbs of the other element. The limbs can flex laterally to allow the serrated faces to ride over each other to enable the panels (24) to be gripped. Screws (26) extending through the base of one element into engagement with the lateral projection on a limb of the other element draw the elements tightly on to the panels (24).
