54 Implement for pre-skiing exercises.

57 The object of the invention is a pre-skiing exercise implement which enables to perform body and leg movements which are similar to those performed when turning (Christiania-like) to the right and to the left during a downhill run. This implement comprises two support bars (2) which are set in a parallel, side-by-side relation in the fashion of a pair of ski, and which are provided with means (3) for fastening to each one of them a ski-boot, either directly or through the respective ski (4). These support bars (2) have their rear end section slidably bearing on an inverted V-shaped supporting cross member (6), and at an intermediate position are supported by an articulated bar-supporting device (7), in which each one of the bars (2) can rock independently from the other bar, around an associated horizontal axis of inclination (X) which is transversal thereto, and both bars (2) can simultaneously perform concordant equal angular movements around associated upstanding axes of rotation (Y), which are vertical, or are preferably inclined rearwardly toward the inverted V rear supporting cross member (6).
