⑤④ **Device for closing and opening the boot lid or rear hatch of a motor vehicle.**

⑤⑦ A device for closing and opening the boot lid or rear hatch of a motor vehicle with a locking mechanism, in which a slidable push button (14) carries a cylinder lock (22) for effecting, through cam means (36,38), the translational movement of a release member (40) of the locking mechanism which is slidable between an operative position and an inoperative position. When the cylinder lock (22) is disposed in a pre-established position, the translational movement of the release member (40) from the inoperative position to the operative position, and vice versa, can also be achieved automatically by means of a servo-mechanism operated by an electrical central locking system for the motor vehicle doors.
