⑹ **Cigarettes.**

⑺ A cigarette is provided which comprises a wrapped filter plus (202, 203) aligned in end-to-end abutting relationship with a substantially cylindrical tobacco rod (201). The filter plus and tobacco rod are circumscribed and joined by a substantially air permeable first layer of tipping paper (204). Circumscribing the first layer of tipping paper is a second layer of substantially air impermeable tipping paper (206). The second layer has a circumferentially extending row of closely spaced perforations (210) intermediate the two ends of the second layer which divides it into a mouth-end sleeve (207) attached to the first layer at the mouth-end of the cigarette and a second rod-end sleeve (208) detachable from the mouth-end sleeve by rotating the sleeve relative to the first sleeve so that it can move axially between the mouth-end sleeve and positions along the tobacco rod allowing air to enter the filter through the exposed portions of the air permeable layers.
