(54) **Automatic machine for carrying out single and double contour pockets.**

(57) The present paper describes a machine with a mobile lower platform (A) which automatically produces pockets on articles of clothing. The fabric (T) is held firmly between the abovelying blades (L1, L2) and the lower mobile platform (A) during sewing operations, in order to avoid dragging the fabric (T) across the lower platform which generally produces

sewing defects along the borders of the pockets. A pressing arm (E) is lowered by means of a piston (F) with an adjustable damper (H). Furthermore, the fold-over blades (L1, L2) are L-shaped in order to maintain the fabric (T) stretched over the cutting and sewing assembly, thereby avoiding wrinkling of the material while it is being sewed.

CATEGORY OF CITED DOCUMENTS			
X : particularly relevant if taken alone		E : earlier patent document, but published on, or after the filing date	
Y : particularly relevant if combined with another document of the same category		D : document cited in the application	
A : technological background		L : document cited for other reasons	
O : non-written disclosure		
P : intermediate document		& : member of the same patent family, corresponding document	
T : theory or principle underlying the invention
