**I-20123 Milano(IT)**(54) **Securing and adjustment device particularly for ski boots.**

(57) A securing and adjustment device particularly usable in ski boots (1) which comprise a vertical lever (5) and/or a knob (8) associated with at least one pulley adapted to takeup at least one traction element (6,9). The peculiarity of the device consists of the fact that it has at least one lever (13) for the partial slackening of the at least one traction element which can be activated independently of the vertical lever and/or the knob. It is thus possible to preset the amount of the slackening of the traction element so as to allow for example a partial opening of the quarters (3,4) and/or slackening of the degree of securing of the foot to allow the skier to walk optimally.
