(54) **Extension leaf for extensible tables.**

(57) The invention relates to an improved board of composition for tables formed by two leveled juxtaposed lateral parts (2)(3) which may simultaneously shift and separate from each other, and a third central part (1) hidden between and under both upper lateral shifting parts, being both lateral shifting parts linked to the respective edge of a cable (8), having the lower surface of the central hidden part some perpendicular supports which lower edges, in their hidden position, lean against the lower upright part of a zigzagging slope (9)(10); when both lateral shifting parts simultaneously separate from each other by the traction of the cable, at the same time the central part raises till it matches the opening left by the separation of both lateral shifting parts, being the descent and hiding of the central part achieved in the same manner but on the contrary way. The necessary mechanisms are located inside two opposite and joint tubes, fixed to two major sides.
