⑴ Foot securing device, particularly for ski boots.

⑷ A foot securing device, for ski boots composed of a shell (302) to which at least one quarter is articulated, containing one or more containers (315) for a fluid. The device includes at least one actuator which interacts, by means of a plate (312) and in contrast with possible elastic means, with at least one tank (314) which is connected to the one or more containers. The actuator thus allows the user to determine beforehand the feeding of the fluid from the tank or the discharge thereof from the one or more containers: it is thus possible to achieve an optimum fit of the foot inside the boot by providing a device which is structurally and operatingly very simple.
