(54) **Method of customization of an article of sport footwear and article provided in accordance with said method**

(57) The method is suited to an article of footwear in which the padding comprises a blister designed to take on a form corresponding to the anatomy of a user and comprises the following steps:

- including a resin in liquid state in the blister during manufacture of the article,
- providing an injection port in the blister,
- providing an external injection means connectable to the injection port,
- including a hardener for the resin in the injection means,

- connecting the injection means to the injection port,
- operating the injection means to inject the hardener into the blister,
- putting on the article on the user's body,
- wearing the article and keeping it in worn condition until hardening of the resin and hardener mixture.

This method separates the step of insertion of the liquid resin in the blisters (which takes place at the works) from the solidification step thereof which can be readily performed by the user.
