(54) Structure of jointing element particularly for the jointing of box-type sections

(57) Structure of jointing element particularly for the jointing of box-type sections (8, 9), the peculiarity of this structure (7) lays in that said structure (7) comprises at least one pair of opposed appendixes (10a, 10b, 11a, 11b) in correspondence to each of the jointed end pieces (8a, 9a) of a first and at least a second section (8, 9), a first and a second superposed body (12, 13) between which are inserted the above-mentioned pairs of appen-

dixes (10a, 10b) of such first section (8) and the abovementioned pairs of appendixes (11a, 11b) of such second section (9), fixing means (18) forcing such bodies (12, 13) against the above-mentioned pairs of appendixes (10a, 10b, 11a, 11b) in order to joint such sections (8, 9) together by means of such structure (7). The invention solves the drawbacks found in the known state of the art, as it allows to effect the jointing operation in simple way at low costs (ref. fig.3).
