(54) **Handle lock for slidable windows provided with a faulty-operation preventing system**

(57) A handle locking device for slidable sashes of a window with a frame consisting of a section member, provided with a faulty-operation preventing system adapted to stop the closing movement of the handle when the sash (12) is not in a closed position in its frame (11), comprises an actuating element (15) movable against the action of a spring (21) between a handle-locked position and a handle-released position with a movement

perpendicular to the sliding movement of the sash (12) and projecting from the handle body (13b) within the section member thickness. Said actuating element (15) is provided with an active free end (14) received in the section member thickness and designed to interfere in the sliding direction of the sash, by a cam-slipping action, with a locating element (20) on the window frame when the sash (12) is brought to a closed position, to move the actuating element (15) to the released position.

**ANNEX TO THE EUROPEAN SEARCH REPORT
ON EUROPEAN PATENT APPLICATION NO.**

EP 04 01 5956

This annex lists the patent family members relating to the patent documents cited in the above-mentioned European search report.
The members are as contained in the European Patent Office EDP file on
The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
