EP 1 723 376 B1

Description

BACKGROUND OF THE INVENTION AND PRIOR ART

[0001] The present invention refers to a heat exchanger plate for a plate package for a plate heat exchanger, wherein the heat exchanger plate extends between a primary edge zone and a secondary edge zone in parallel with a central extension plane, an upper plate plane and a lower plate plane, wherein the central extension plane includes a centre axis dividing the heat exchanger plate in a primary part and a secondary part, and wherein the heat exchanger plate includes a first end area, a second end area, a central heat transfer area, which extends between the primary edge zone and the secondary edge zone from the first end area to the second end area, a primary porthole and a secondary porthole, which extend through the heat exchanger plate in the first end area and which are surrounded by a respective adjoining edge area, wherein the primary porthole is located on the primary part and the secondary porthole on the secondary part, and a distribution area which extends on the first end area and has a base surface extending from the primary porthole to the central heat transfer area. GB-A-20 548 17 discloses such a heat exchanger plate.

[0002] The invention also refers to a plate package for a plate heat exchanger including at least two heat exchangers plates as defined above with a plate interspace therebetween, wherein each heat exchanger plate extends between a primary edge zone and a secondary edge zone in parallel with a central extension plane, an upper plate plane and a lower plate plane, wherein the central extension plane includes a centre axis dividing the heat exchanger plate in a primary part and a secondary part, and wherein the heat exchanger plate includes a first end area, a second end area, a central heat transfer area, which extends between the primary edge zone and the secondary edge zone from the first end area to the second end area, a primary porthole and a secondary porthole, which extend through the heat exchanger plate in the first end area and which are surrounded by a respective adjoining edge area, wherein the primary porthole is located on the primary part and the secondary porthole on the secondary part, and a distribution area which extends on the first end area and has a base surface extending from the primary porthole to the central heat transfer area.

[0003] In such plate heat exchangers, it is desirable that the main heat transfer takes place at the central heat transfer area of the plates. The distribution areas which adjoin the portholes have the function of distributing the media in a uniform manner to the central heat transfer area in such way that the heat transfer takes place uniformly over the whole central heat transfer area. It is known to provide such a distribution by means of special corrugations of the distribution area. These corrugations guide the media flow in such a way that it is uniformly distributed to the central heat transfer area. A disadvantage of such known distribution patterns is that they also contribute to a too large pressure drop over the distribution area. Such a pressure drop deteriorates the efficiency of the plate heat exchanger and contributes to a too large heat transfer outside the central heat transfer area.

[0004] A limitation in this context is the strength of the plate heat exchanger in the distribution area. In plate heat exchangers where the heat exchanger plates are permanently joined to each other, for instance by brazing, strong tensile stresses arise in the plate package when media under high pressure is conveyed through the plate heat exchanger. In plate heat exchangers compressed between a frame plate and a pressure plate, strong compressive stresses arise in the plate package due to the pretensioning. In order to resist such tensile stresses and compressive stresses in the distribution area, there must be a certain number of contact points or contact spots between adjacent heat exchanger plates. In brazed plate heat exchangers, the heat exchanger plates are joined to each other at these points or spots. In order to resist the different kind of stresses it is also important that these contact points are arranged substantially straight above each other, i.e. that they form an as straight as possible line through the whole plate package.

[0005] SE-B-415 928 discloses a plate heat exchanger having a number of heat exchanger plates which each extends in parallel to a central extension plane. Each plate includes a first end area having a primary porthole and a secondary porthole, a second end area having a primary porthole and a secondary porthole, and central heat transfer area, which extends from the first end area to the second end area. The portholes for the inlet and the outlet of one and the same fluid are arranged at the same side of the plate. The central heat transfer area has a corrugation, which creates a number of passages designed in such a way that the passages are thinner at the side of the plate where the inlet and the outlet for the same fluid are located.

[0006] WO85/02670 discloses a plate heat exchanger having a number of heat exchangers plates which each extends in parallel to a central extension plane. Each plate includes a first end area having a primary porthole and secondary porthole, a second end area having a primary porthole and a secondary porthole, and central heat transfer area, which extends from the first end area to the second end area. The portholes for the inlet and the outlet for one and the same fluid are arranged at the same side of the plate. A first distribution area extends on the first end area and a second distribution area extends on the second end area. The distribution areas and the central heat transfer area have corrugations extending in such directions that the flow resistance in the plate interspaces between the distribution areas is smaller than the flow resistance in the plate interspaces between the central heat transfer areas.

[0007] GB-A-2 054 817 discloses a plate heat exchanger having a number of heat exchanger plates, which each extends between a left edge and a right edge

in parallel to a central extension plane, an upper plate plane and a lower plate plane. The central extension plane includes a centre axis dividing the plate in a left part and a right part. The plate includes a first end area, a second end area and a central heat transfer area, which extends between the left edge and the right edge from the first end area to the second end area. An inlet porthole and an outlet porthole extend through the plate in the first end area and are surrounded by a respective adjoining edge area. The inlet porthole is located on the left part and the outlet porthole on the right part. A distribution area extends from the first end area and has a base surface which appears to be parallel to the central extension plane and which extends from the inlet porthole to the heat transfer area. On this base surface one or several separated distribution members are attached. The distribution member is designed in such a way that it is located at an upper level in the proximity of the upper plate plane in the proximity of the edge area of the inlet porthole and sinks successively to a lower level in the proximity of the lower plate plane in the proximity of the left edge.

SUMMARY OF THE INVENTION

[0008] The object of the present invention is to provide a heat exchanger plate intended for a plate package in a plate heat exchanger and including an improved distribution area.

[0009] A further object of the present invention is to provide such a heat exchanger plate contributing to a low flow resistance in the distribution area.

[0010] A further object of the present invention is to provide such a heat exchanger plate that contributes to a high strength for the plate heat exchanger in the distribution area.

[0011] This object is achieved by the heat exchanger plate initially defined, which is **characterised in that** the base surface is located at an upper level in the proximity of the upper plate plane in the proximity of the edge area of the primary porthole and sinks successively to a lower level in the proximity of the lower plate plane in the proximity of the secondary edge zone. By such a design of the distribution area, the plate interspace between two heat exchanger plates in the plate package may obtain an increasing flow area with an increasing distance from the primary porthole forming the inlet port of the plate package. More precisely, the height of the plate interspace will be relatively small in an area close to the inlet port and increase successively in a direction towards the opposite secondary edge zone. This design contributes to a uniform distribution of the medium which enters via the primary porthole over the whole inlet to, i.e. the width of, the central heat transfer area.

[0012] According to a further embodiment of the invention, the shape of the distribution area is produced through a compression-moulding of the heat exchanger plate. In such a way, this advantageous design of the distribution area may also be obtained in an easy manner to a low cost. No further components or elements are needed in the plate package.

[0013] According to a further embodiment of the invention, the base surface sinks successively along a border to the central heat transfer area from in the proximity of the primary edge zone to in the proximity of the secondary edge zone. In such a way, the flow resistance of the medium to the more remote parts of the distribution area may, seen from the primary porthole where the media is intended to enter, be reduced so that a uniform distribution of the media along the whole central heat transfer area is achieved.

[0014] According to a further embodiment of the invention, the base surface sinks continuously from the upper level to the lower level. It is to be noted that by the expression "successively" not only such a continuous sinking of the base surface is intended but also for instance a gradually sinking of the base surface in such a way that the base surface forms a plurality of gradually lower portions which each is substantially parallel to the central extension plane. The continuous sinking mentioned above may be obtained by a substantially plane base surface or a somewhat curved base surface.

[0015] According to a further embodiment of the invention, the distribution area and the base surface extend over substantially the whole first end area.

[0016] According to a further embodiment of the invention, the distribution area includes a number of projections and depressions, wherein substantially each projection extends in a respective direction running from the primary porthole towards the central heat transfer area. Such projections will thus guide the medium flowing from the primary porthole towards the central heat transfer area. Advantageously, substantially each projection may reach the upper plate plane and substantially each depression may reach the lower plate plane. In such a way, the projections and depressions of adjacent heat exchanger plates in the plate package may form mutual supports to each other in the form of points, lines or areas.

[0017] According to a further embodiment of the invention, substantially each projection has a length which is substantially shorter than the distance from the primary porthole to central heat transfer area along the direction of the projection.By means of the shortening of the projections in this way, the medium will not be confined in channels between the projections but may flow freely and in such a way be distributed in a better way over the whole distribution area. Furthermore, the flow resistance may be kept at a low level by means of such short projections.

[0018] According to a further embodiment of the invention, substantially each depression extends substantially perpendicular to said respective direction of an adjacent projection. The depressions have a very small influence on the flow. The depressions project, however, into the adjacent plate interspace and guide the medium that flows therein from the secondary part to the primary part with regard to this heat exchanger plate. Substantially

each depression may then extend in a respective direction running from the secondary porthole towards the central heat transfer area. Also substantially each depression has advantageously a length which is substantially shorter than the distance from the secondary porthole to the central heat transfer area along the direction of the depression.

[0019] According to a further embodiment of the invention, each projection and each depression have two ends and two long sides, wherein substantially each projection, which is located on the secondary part, with one of the ends extends to one of the long sides of a depression, and wherein substantially each depression, which is located on the primary part, with one of the ends extends to one of the long sides of a projection. By such a location of the projections and depressions, a relatively free flow is achieved for the media flowing through the plate package and at the same time favourable support points are formed between adjacent heat exchanger plates. In particular, it is to be noted that the support points or support lines are located in such a way that they lie substantially straight above each other through the whole plate package. Such a support line extending substantially straight through the whole plate package is especially advantageous for absorbing the tensile stresses arising in a plate heat exchanger where the plates are permanently joined to each other through for instance brazing, or the compressive stresses arising in a plate heat exchanger where the plates are pressed against each other.

[0020] According to a further embodiment of the invention, the heat exchanger plate is symmetric with regard to the centre axis in such a way that most of the depressions have a shape and a position corresponding to the shape and the position of a projection on the other side of the centre axis, wherein each depression is design to abut a projection of an adjacent turned heat exchanger plate in the plate package.

[0021] The object is also achieved by the plate package initially defined, which is **characterised in that** the base surface is located at an upper level in the proximity of the upper plate plane in the proximity of the edge area of the primary porthole and sinks successively to a lower level in the proximity of the lower plate plane in the proximity of the secondary edge zone. By such a design of the distribution area, the plate interspace will have an increasing flow area with an increasing distance from the primary porthole forming the inlet port of the plate package. More precisely, the height of the plate interspace will be relatively small in an area close to the inlet port and increase successively in a direction towards the opposite secondary edge zone. In such a way, a uniform distribution of the medium, which enters via the primary porthole channel over the whole inlet to the central heat transfer area, is achieved.

[0022] Advantageous embodiments of the plate package are defined in the dependent claims 15 to 26. Advantageously, the heat exchanger plates may then be arranged in an alternating order in such a way that the primary part at the first end area of a first heat exchanger plate adjoins the secondary part of an adjacent second heat exchanger plate, wherein the height of the plate interspace decreases successively from in the proximity of the edge area of the primary porthole with regard to the first heat exchanger plate to in the proximity of the secondary edge zone with regard to the first heat exchanger plate. This height may decrease continuously or gradually. Furthermore, it is to be mentioned that the heat exchanger plates may be arranged in an alternating order in such a way that the primary part at the first end area of a first heat exchanger plate adjoins the secondary part of an adjacent second heat exchanger plate, wherein substantially each depression of the first heat exchanger plate abuts a projection of the adjacent second heat exchanger plate. The heat exchanger plates may advantageously be permanently joined to each other.

BRIEF DESCRIPTION OF THE DRAWINGS

[0023] The present invention is now to be explained more closely through a description of various embodiments, disclosed by way of example, and with reference to the drawings attached hereto.

- Fig. 1 discloses schematically an elevation view of a plate heat exchanger according to an embodiment of the invention.
- Fig. 2 discloses schematically a side view of the plate heat exchanger in Fig. 1.
- Fig. 3 discloses schematically an elevation view of the heat exchanger plate of the plate heat exchanger in Fig. 1.
- Fig. 4 discloses a cross-sectional view through a plate package with heat exchanger plates along the line IV- IV in Fig. 3.
- Fig. 5 discloses schematically a side view of a plate heat exchanger according to a second embodiment of the invention.

DETAILED DESCRIPTION OF VARIOUS EMBODIMENTS OF THE INVENTION

[0024] Figs. 1 and 2 disclose schematically a plate heat exchanger according to a first embodiment of the invention. The plate heat exchanger includes a number of heat exchanger plates 1, see Fig. 3, which are arranged beside each other in such a way that they form a plate package 2. In the first embodiment, the heat exchanger plates 1 in the plate package 2 are permanently joined to each other through for instance brazing in a manner known per se. The plate heat exchanger includes a first inlet port 4 and a first outlet port 5 for a first medium, and a second inlet port 6 and a second outlet port 7 for a second medium.

[0025] Each heat exchanger plate 1 has in the embodiment disclosed a substantially rectangular basic shape and extends between a primary edge zone 11a and a

secondary edge zone 12a in parallel with a central extension plane 13, an upper plate plane 14 and a lower plate plane 15, see Fig. 4. The central extension plane 13 includes a longitudinal centre axis x which divides the heat exchanger plate 1 in a primary part 11 and a secondary part 12. Each heat exchanger plate 1 also includes a first end area 16, a second end area 17 and a central heat transfer area 18. The central heat transfer area 18 extends between the primary edge zone 11a and the secondary edge zone 12a and from the first end area 16 to the second end area 17.

[0026] Each heat exchanger plate also includes four portholes 21, 23, which each extends through the heat exchanger plate 1. These four portholes 21, 23 in the heat exchanger plates 1 in the plate package 2 form the above mentioned inlet and outlet ports 4-7. The portholes 21, 23 are located at the two end areas 16 and 17, and form a primary porthole 21 on the primary part 11 of each of the first and second end areas 16, 17, and a secondary porthole 23 on the secondary part 12 of each of the first and second end areas 16, 17. Each porthole 21, 23 is surrounded by a respective adjoining edge area 25.

[0027] Each of the first end area 16 and the second end area 12 includes distribution area 26, which extends over substantially the whole respective end area 16, 17 except for the portholes 21, 23. Each distribution area 26 has a base surface 27, which extends over substantially the whole distribution area 26. The base surface 27 of the distribution areas 26 is inclined in relation to the central extension plane 13 and is located at an upper level in the proximity of the upper plate plane 14 in the proximity of the edge area 25 of the primary porthole 21 and sinks successively to a lower level in the proximity of the lower plate plane 15 in the proximity of the secondary edge zone 12a. The base surface 27 of the distribution areas 26 also sinks successively along a border to the central heat transfer area 18 from in the proximity of the primary edge zone 11a to in the proximity of the secondary edge zone 12a. In the embodiment disclosed, the base surface 27 of the distribution areas 26 sinks continuously from the upper level to the lower level. It is to be noted that the base surface 27 also may sink gradually between successively lower levels which are substantially parallel to the central extension plane 13.

[0028] The distribution area 26 of both the end areas 16, 17, see Fig. 3, includes also a number projections 31 which project from the base surface 27 to substantially the upper plate plane 14, and a number of depressions 32, which sink from the base surface 27 to substantially the lower plate plane 15. Substantially each projection 31 extends along a respective path running from the primary porthole 21 towards the central heat transfer area 18. Substantially each projection 31 has, at least in a central part of the distribution area 26, a length which is substantially shorter than the distance from the primary porthole 21 to the central heat transfer area 18 along the direction of the projection 31 in question.

[0029] In a corresponding manner, substantially each depression 32 extends along a respective path running from the secondary porthole 23 towards the central heat transfer area 18. Consequently, substantially each depression 32 extends substantially perpendicularly to the respective direction of an adjacent projection 31, i.e. the directions of the projections 31 and the depressions 32 are substantially orthogonal in the points where these directions intersect. Also substantially each depression 32 has, at least in a central part of the distribution area 26, a length which is substantially shorter than the di stance from the secondary porthole 23 to the central heat transfer area 18 along the direction of the depression 32 in question.

[0030] Substantially each projection 31 and substantially each depression 32 have two ends and two long sides. The projections 31 and the depressions 32 are arranged in such a way that substantially each projection 31, which is located on the secondary part 12, with one of the ends extends to one of the long sides of the depression 32 and substantially each depression 32, which is located on the primary part 11, extends with one of the ends to one of the long sides of a projection 31.

[0031] Furthermore, the heat exchanger plate 1 is symmetric with regard to the longitudinal centre axis x in such a way that most of the depressions 32 have a shape and a position which correspond to the shape and the position of a projection 31 on the other side of the longitudinal centre axis x. Thanks to such a symmetry and due to the fact that every second heat exchanger plate 1 in the plate package 2 is rotated 180°, each depression 32 will abut a projection 31 of an adjacent heat exchanger plate 1 in the plate package 2, see Fig. 4. This symmetry also means that the primary porthole 21 of the first end area 16 is located on the same side of the centre axis x as the primary porthole 21 of the second end area 17, i.e. both the primary portholes 21 are located on the primary part 11 and both the secondary portholes are located on the secondary part 12.

[0032] It is to be noted that a few of the projections 33 and the depressions 34 along the centre axis x deviate from this symmetry since these projections and depression 34, respectively, have been divided in two shorter projections 33 and depressions 34, respectively, which from two directions extend to a respective depression 32 and projection 31.

[0033] Substantially all heat exchanger plates 1 in the plate package 2 are thus identical. In the fist embodiment, the heat exchanger plates 1 are also permanently joined to each other by any suitable method such as brazing. Each projection 31 is then permanently joined to a depression 32 of an adjacent heat exchanger plate 1.

[0034] The heat exchanger plates 1 have been manufactured through compression-moulding in one step from substantially plane plates. Preferably after the compression-moulding, the portholes 21-24 have been punched from the heat exchanger plates 1. The distribution area 26 of the end areas 16, 17 has thus obtained its shape through said compression-moulding. In the

same compression-moulding step, also the central heat transfer area 18 has obtained the shape disclosed with two corrugations 36 and 37 of ridges and valleys, see Fig. 3. The corrugation 36 adjoins the first end area 16 and the corrugation 37 adjoins the second end area 17. The corrugation 36 includes ridges and valleys forming channels 38 extending obliquely over the central heat transfer area 18 from the secondary edge zone 12a to the primary edge zone 11a with an angle of inclination that is about 45° in relation to the longitudinal centre axis x. The channels 38 have a decreasing width in such a way that the channels 38 are wider in the proximity of the secondary edge zone 12a and taper successively when the channels 38 approach the primary edge zone 11. In the same manner the corrugation 37 includes ridges and valleys forming channels 39 extending obliquely over the central heat transfer area from the primary edge zone 11 a to the secondary edge zone 12a with an angle of inclination that is about 45° in relation to the longitudinal centre axis x, i.e. about perpendicular to the direction of the channels 38. Furthermore, also the channels 39 have an increasing width in such a way that the channels 39 are thinner in the proximity of the primary edge zone 11a and becomes successively wider when the channels 39 approach the secondary edge zone 11.

[0035] Fig. 4 discloses a section through the plate package 2. As appear a plate interspace 40 is formed between each adjacent pair of heat exchanger plates 1. The heat exchanger plates 1 are arranged in an alternating order in such a way that the primary part 11 in the first end area of a first heat exchanger plate 1 adjoins the secondary part 12 of an adjacent second heat exchanger plate 1. Consequently, the height of the plate interspace 40 will decrease successively from the edge area 25 of the primary porthole 21, 22 with regard to the first heat exchanger plate 1, or the edge area 25 of the secondary porthole 23, 24 with regard to the second heat exchanger plate 1, to the secondary edge zone 12a with regard to the first heat exchanger plate 1, or to the primary edge zone 11a with regard to the second heat exchanger plate 1. In the embodiment disclosed the heights of the plate interspace 40 decreases continuously.

[0036] In the embodiment disclosed, one of the media will thus flow into primary porthole 21 of the first end area 16 to the plate interspace 40 concerned and be distributed uniformly over the whole width of the plate interspace at the transition to the central heat transfer area 18. Thanks to the tapering channels 38 and thereafter the expanding channels 39 a uniformly distributed flow over the whole central heat transfer area 18 is ensured. At the second end area 17, the projections 31 of the distribution area 26 will convey the med ium to the primary porthole 21 where the medium leaves the plate interspace 40.

[0037] Fig. 5 discloses a plate heat exchanger according to a second embodiment, which differs from the first embodiment in that the heat exchanger plates 1 are pressed against each other between a frame plate 50 and a pressure plate 51 by means of tie bolts 52 in a manner known per se. The heat exchanger plates 1 have the same design as in the fi rst embodiment with regard to the end areas 16 and 17 and the central heat transfer area 18.

[0038] The invention is not limited to the embodiments disclosed but may be varied and modified within the scope of the following claims.

Claims

1. A heat exchanger plate for a plate package (2) for a plate heat exchanger, wherein the heat exchanger plate (1) extends between a primary edge zone (11a) and a secondary edge zone (12a) in parallel with a central extension plane (13), an upper plate plane (14) and a lower plate plane (15), wherein the central extension plane includes a centre axis (x) dividing the heat exchanger plate (1) in a primary part (11) and a secondary part (12), and wherein the heat exchanger plate includes
   a first end area (16),
   a second end area (17),
   a central heat transfer area (18), which extends between the primary edge zone (11a) and the secondary edge zone (12a) from the first end area (16) to the second end area (17),
   a primary porthole (21) and a secondary porthole (23), which extend through the heat exchanger plate (1) in the first end area (16) and which are surrounded by a respective adjoining edge area (25), wherein the primary porthole (21) is located on the primary part (11) and the secondary porthole (23) on the secondary part (12), and
   a distribution area (26) which extends on the first end area (16) and has a base surface (27) extending from the primary porthole (21) to the central heat transfer area (18), **characterised in that** the base area (27) is located at an upper level in the proximity of the upper plate plane (14) in the proximity of the edge area (25) of the primary porthole (21) and sinks successively to a lower level in the proximity of the lower plate plane (15) in the proximity of the secondary edge zone (12a).

2. A heat exchanger plate according to claim 1, **characterised in that** the shape of the distribution area (26) has been produced through compression-moulding of the heat exchanger plate (1).

3. A heat exchanger plate according to any one of claims 1 and 2, **characterised in that** the base surface (27) sinks successively along a border to the central heat transfer area (18) from in the proximity of the primary edge zone (11a) to in the proximity of the secondary edge zone (12a).

4. A heat exchanger plate according to any one of claims 1 to 3, **characterised in that** the base surface (27) sinks continuously from the upper level to the lower level.

5. A heat exchanger plate according to any one of the preceding claims, **characterised in that** the distribution area (26) and the base surface (27) extend over substantially the whole first end area (16).

6. A heat exchanger plate according to any one of the preceding claims, **characterised in that** the distribution area (26) includes a number of projections (31) and depressions (32), wherein substantially each projection (31) extends in a respective direction running from the primary porthole (21) towards the central heat transfer area (18).

7. A heat exchanger plate according to claim 6, **characterised in that** substantially each projection (31) reaches the upper plate plane (14) and that substantially each depression (32) reaches the lower plate plane (15).

8. A heat exchanger plate according to any one of claims 6 and 7, **characterised in that** substantially each projection (31) has a length which is substantially shorter than the distance from the primary porthole (21) to the central heat transfer area (18) along the direction of the projection (31).

9. A heat exchanger plate according of any one of claims 7 and 8, **characterised in that** substantially each depression (32) extends substantially perpendicularly to said respective direction of an adjacent projection (31).

10. A heat exchanger plate according to any one of claims 6 to 9, **characterised in that** substantially each depression (32) extends in a respective direction running from the secondary porthole (23) towards the central heat transfer area (18).

11. A heat exchanger plate according to any one of claims 9 and 10, **characterised in that** substantially each depression (32) has a length which is substantially shorter than the distance from the secondary porthole (23) to the central heat transfer area (18) along the direction of the depression (32).

12. A heat changer plate according to any one of claims 6 to 11, **characterised in that** each projection (31) and each depression (32) have two ends and two long sides, wherein substantially each projection (31), which is located on the secondary part (12), with one of the ends extends to one of the long sides of a depression (32) and wherein substantially each depression (32), which is located on the primary part (11), with one the end extends to one of the long sides of a projection (31).

13. A heat exchanger plate according to any one of claims 6 to 12, **characterised in that** the heat exchanger plate (1) is symmetrical with regard to the centre axis (x) in such a way that substantially each depression (32) has a shape and a position corresponding to the shape and the position of a projection (31) on the other side of the centre axis (x), wherein each depression (32) is designed to abut a projection (31) of an adjacent turned heat exchanger plate (1) in the plate package (2).

14. A plate package for a plate heat exchanger including at least two heat exchangers plates (1) with a plate interspace (40) therebetween, wherein each heat exchanger plate (1) extends between a primary edge zone (11a) and a secondary edge zone (12a) in parallel with a central extension plane (13), an upper plate plane (14) and a lower plate plane (15), wherein the central extension plane (13) includes a centre axis (x) dividing the heat exchanger plate (1) in a primary part (11) and a secondary part (12), and wherein the heat exchanger plate includes
a first end area (16),
a second end area (17),
a central heat transfer area (18), which extends between the primary edge zone (11 a) and the secondary edge zone (12a) from the first end area (16) to the second end area (17),
a primary porthole (21) and a secondary porthole (23), which extend through the heat exchanger plate (1) in the first end area (16) and which are surrounded by a respective adjoining edge area (25), wherein the primary porthole (21) is located on the primary part (11) and the secondary porthole (23) on the secondary part (12), and
a distribution area (26) which extends on the first end area (16) and has a base surface (27) extending from the primary porthole (21) to the central heat transfer area (18), **characterised in that** the base area (27) is located at an upper level in the proximity of the upper plate plane (14) in the proximity of the edge area (25) of the primary porthole (21) and sinks successively to a lower level in the proximity of the lower plate plane (15) in the proximity of the secondary edge zone (12a).

15. A plate package according to claim 14, **characterised in that** the heat exchanger plates (1) are arranged in alternating order in such a way that the primary part (11) in the first end area (16) of a first heat exchanger plate (1) adjoins the secondary part of an adjacent second heat exchanger plate (1), wherein the height of the plate interspace (40) decreases successively from in the proximity of the edge area (25) of the primary porthole (21) with re-

gard to the heat exchanger plate (1) to in the proximity of the secondary edge zone (12a) with regard to the first heat exchanger plate (1).

16. A plate package according to claim 15, **characterised in that** the height of the plate interspace (40) decreases continuously.

17. A plate package according to any one of claims 14 to 16, **characterised in that** the distribution area (26) includes a number of projections (31) and depressions (32), wherein substantially each projections (31) extends in a respective direction running from the primary porthole (21) towards the central heat transfer area (18).

18. A plate package according to claim 17, **characterised in that** substantially each projection (31) reaches the upper plate plane (14) and that substantially each depression (32) reaches the lower plate plane (15).

19. A plate package according to any one of claims 17 and 18, **characterised in that** substantially each projection (31) has a length which is substantially shorter than the distance from the primary porthole (21) to the central heat transfer area (18) along the direction of the projection (31).

20. A plate package according to any one of claims 17 to 19, **characterised in that** substantially each depression (32) extends substantially perpendicularly to said respective direction of an adjacent projection (31).

21. A plate package according to any one of claims 17 to 20, **characterised in that** substantially each depression (32) extends in a respective direction running from the secondary porthole (23) towards the central heat transfer area (18).

22. A plate package according to any one of claims 20 and 21, **characterised in that** substantially each depression (32) has a length which is substantially shorter than the distance from the primary porthole (21) to the central heat transfer area (18) along the direction of the depression (32).

23. A plate package according to any one of claims 17 to 22, **characterised in that** each projection (31) and each depression (32) have two ends and two long sides, wherein substantially each projection (31), which is located on the secondary part (12), with one of the ends extends to one of the long sides of a depression (32) and wherein substantially each depression (32), which is located on the primary part (11), with one of the ends extends to one of the long sides of a projection (31).

24. A plate package according to any one of claims 17 to 23, **characterised in that** the heat exchanger plates (1) are arranged in an alternating order in such way that the primary part (11) in the first end area (16) of a first heat exchanger plate (1) adjoins the secondary part (12) of an adjacent second heat exchanger plate (1), wherein substantially each depression (32) of the first heat exchanger plate (1) abuts a projection (31) of the adjacent second heat exchanger plate (1).

25. A plate package according of any one of claims 14 to 24, **characterised in that** substantially all heat exchanger plates (1) are identical.

26. A plate package according to any one of claims 14 to 25, **characterised in that** the heat exchanger plates (1) are permanently joined to each other.

Patentansprüche

1. Wärmetauschplatte für einen Plattenstapel (2) für einen Plattenwärmetauscher, wobei sich die Wärmetauschplatte (1) zwischen einer primären Kantenzone (11a) und einer sekundären Kantenzone (12a) parallel zu einer zentralen Ausdehnungsebene (13), einer oberen Plattenebene (14) und einer unteren Plattenebene (15) erstreckt, wobei die zentrale Ausdehnungsebene eine Mittelachse (x) umfasst, die die Wärmetauschplatte (1) in einen Primärteil (11) und einen Sekundärteil (12) unterteilt, und wobei die Wärmetauschplatte
einen ersten Endbereich (16) umfasst sowie
einen zweiten Endbereich (17),
einen zentralen Wärmeübertragungsbereich (18), der sich zwischen der primären Kantenzone (11a) und der sekundären Kantenzone (12a) vom ersten Endbereich (16) zum zweiten Endbereich (17) erstreckt,
ein primäres Durchgangsloch (21) und ein sekundäres Durchgangsloch (23), die sich durch die Wärmetauschplatte (1) im ersten Endbereich (16) erstrekken und die von einem jeweiligen angrenzenden Kantenbereich (25) umgeben werden, wobei sich das primäre Durchgangsloch (21) am Primärteil (11) und das sekundäre Durchgangsloch (23) am Sekundärteil (12) befindet, und
einen Verteilungsbereich (26), der sich auf dem ersten Endbereich (16) erstreckt und eine Grundfläche (27) hat, die sich vom primären Durchgangsloch (21) zum zentralen Wärmeübertragungsbereich (18) erstreckt,
dadurch gekennzeichnet, dass sich der Grundbereich (27) in einem oberen Bereich in der Nähe der oberen Plattenebene (14) in der Nähe des Kantenbereichs (25) des primären Durchgangslochs (21) befindet und sukzessive auf einen niedrigeren Be-

reich in der Nähe der unteren Plattenebene (15) in der Nähe der sekundären Kantenzone (12a) absinkt.

2. Wärmetauschplatte nach Anspruch 1, **dadurch gekennzeichnet, dass** die Form des Verteilungsbereiches (26) durch Pressformen der Wärmetauschplatte (1) erzeugt worden ist.

3. Wärmetauschplatte nach Anspruch 1 oder 2, **dadurch gekennzeichnet, dass** die Grundfläche (27) sukzessive entlang einer Grenze zum zentralen Wärmeübertragungsbereich (18) von einem Bereich in der Nähe der primären Kantenzone (11a) zu einem Bereich in der Nähe der sekundären Kantenzone (12a) absinkt.

4. Wärmetauschplatte nach einem der Ansprüche 1 bis 3, **dadurch gekennzeichnet, dass** die Grundfläche (27) kontinuierlich vom oberen Bereich zum unteren Bereich absinkt.

5. Wärmetauschplatte nach einem der vorangegangenen Ansprüche, **dadurch gekennzeichnet, dass** sich der Verteilungsbereich (26) und die Grundfläche (27) über im Wesentlichen den gesamten ersten Endbereich (16) erstrecken.

6. Wärmetauschplatte nach einem der vorangegangenen Ansprüche, **dadurch gekennzeichnet, dass** der Verteilungsbereich (26) eine Anzahl von Vorsprüngen (31) und Vertiefungen (32) aufweist, wobei sich im Wesentlichen jeder Vorsprung (31) in einer jeweiligen Richtung erstreckt, die vom primären Durchgangsloch (21) zum zentralen Wärmeübertragungsbereich (18) verläuft.

7. Wärmetauschplatte nach Anspruch 6, **dadurch gekennzeichnet, dass** im Wesentlichen jeder Vorsprung (31) die obere Plattenebene (14) erreicht und dass im Wesentlichen jede Vertiefung (32) die untere Plattenebene (15) erreicht.

8. Wärmetauschplatte nach einem der Ansprüche 6 und 7, **dadurch gekennzeichnet, dass** im Wesentlichen jeder Vorsprung (31) eine Länge hat, die wesentlich kürzer ist als der Abstand zwischen dem primären Durchgangsloch (21) zum zentralen Wärmeübertragungsbereich (18) entlang der Richtung des Vorsprungs (31).

9. Wärmetauschplatte nach einem der Ansprüche 7 und 8, **dadurch gekennzeichnet, dass** sich im Wesentlichen jede Vertiefung (32) im Wesentlichen senkrecht zur entsprechenden Richtung eines benachbarten Vorsprungs (31) erstreckt.

10. Wärmetauschplatte nach einem der Ansprüche 6 bis 9, **dadurch gekennzeichnet, dass** sich im Wesentlichen jede Vertiefung (32) in einer jeweiligen Richtung erstreckt, die vom sekundären Durchgangsloch (23) zum zentralen Wärmeübertragungsbereich (18) verläuft.

11. Wärmetauschplatte nach einem der Ansprüche 9 und 10, **dadurch gekennzeichnet, dass** im Wesentlichen jede Vertiefung (32) eine Länge hat, die wesentlich kürzer ist als der Abstand zwischen dem sekundären Durchgangsloch (23) und dem zentralen Wärmeübertragungsbereich (18) entlang der Richtung der Vertiefung (32).

12. Wärmetauschplatte nach einem der Ansprüche 6 bis 11, **dadurch gekennzeichnet, dass** jeder Vorsprung (31) und jede Vertiefung (32) zwei Enden und zwei lange Seiten haben, wobei sich im Wesentlichen jeder Vorsprung (31), der sich auf dem Sekundärteil (12) befindet, mit einem der Enden zu einer der Längsseiten einer Vertiefung (32) erstreckt und wobei sich im Wesentlichen jede Vertiefung (32), die sich auf dem Primärteil (11) befindet, mit einem der Enden zu einer der Längsseiten eines Vorsprungs (31) erstreckt.

13. Wärmetauschplatte nach einem der Ansprüche 6 und 12, **dadurch gekennzeichnet, dass** die Wärmetauschplatte (11) auf eine solche Weise in Bezug auf die Mittelachse (x) symmetrisch ist, dass im Wesentlichen jede Vertiefung (32) eine Form und eine Position hat, die der Form und der Position eines Vorsprungs (31) auf der anderen Seite der Mittelachse (x) entspricht, wobei jede Vertiefung (32) so ausgestaltet ist, dass sie an einem Vorsprung (31) einer benachbarten gedrehten Wärmetauschplatte (1) im Plattenstapel (2) anliegt.

14. Plattenstapel für einen Plattenwärmetauscher mit mindestens zwei Wärmetauschplatten (1) mit einem Plattenzwischenraum (40) dazwischen, wobei sich die Wärmetauschplatte (1) zwischen einer primären Kantenzone (11a) und einer sekundären Kantenzone (12a) parallel zu einer zentralen Ausdehnungsebene (13), einer oberen Plattenebene (14) und einer unteren Plattenebene (15) erstreckt, wobei die zentrale Ausdehnungsebene eine Mittelachse (x) umfasst, die die Wärmetauschplatte (1) in einen Primärteil (11) und einen Sekundärteil (12) unterteilt, und wobei die Wärmetauschplatte
einen ersten Endbereich (16) umfasst sowie
einen zweiten Endbereich (17),
einen zentralen Wärmeübertragungsbereich (18), der sich zwischen der primären Kantenzone (11a) und der sekundären Kantenzone (12a) vom ersten Endbereich (16) zum zweiten Endbereich (17) erstreckt,
ein primäres Durchgangsloch (21) und ein sekundäres Durchgangsloch (23), die sich durch die Wärme-

tauschplatte (1) im ersten Endbereich (16) erstrekken und die von einem jeweiligen angrenzenden Kantenbereich (25) umgeben werden, wobei sich das primäre Durchgangsloch (21) am Primärteil (11) und das sekundäre Durchgangsloch (23) am Sekundärteil (12) befindet, und
einen Verteilungsbereich (26), der sich auf dem ersten Endbereich (16) erstreckt und eine Grundfläche (27) hat, die sich vom primären Durchgangsloch (21) zum zentralen Wärmeübertragungsbereich (18) erstreckt,
dadurch gekennzeichnet, dass sich der Grundbereich (27) in einem oberen Bereich in der Nähe der oberen Plattenebene (14) in der Nähe des Kantenbereichs (25) des primären Durchgangslochs (21) befindet und sukzessive auf einen niedrigeren Bereich in der Nähe der unteren Plattenebene (15) in der Nähe der sekundären Kantenzone (12a) absinkt.

15. Plattenstapel nach Anspruch 14, **dadurch gekennzeichnet, dass** die Wärmetauschplatten (1) in alternierender Reihenfolge auf eine solche Weise angeordnet sind, dass der Primärteil (11) im ersten Endbereich (16) einer ersten Wärmetauschplatte (1) an den Sekundärteil einer benachbarten zweiten Wärmetauschplatte (1) angrenzt, wobei die Höhe des Plattenzwischenraumes (40) sukzessive von einem Bereich in der Nähe des Kantenbereiches (25) des primären Durchgangsloches (21) in Bezug auf die Wärmetauschplatte (1) zu einem Bereich in der Nähe der sekundären Kantenzone (12a) in Bezug auf die erste Wärmetauschplatte (1) hin abnimmt.

16. Plattenstapel nach Anspruch 15, **dadurch gekennzeichnet, dass** die Höhe des Plattenzwischenraumes (40) kontinuierlich abnimmt.

17. Plattenstapel nach einem der Ansprüche 14 bis 16, **dadurch gekennzeichnet, dass** der Verteilungsbereich (26) eine Anzahl von Vorsprüngen (31) und Vertiefungen (32) umfasst, wobei sich im Wesentlichen jeder Vorsprung (31) in einer jeweiligen Richtung erstreckt, die vom primären Durchgangsloch (21) zum zentralen Wärmeübertragungsbereich (18) verläuft.

18. Plattenstapel nach Anspruch 17, **dadurch gekennzeichnet, dass** im Wesentlichen jeder Vorsprung (31) die obere Plattenebene (14) erreicht und dass im Wesentlichen jede Vertiefung (32) die untere Plattenebene (15) erreicht.

19. Plattenstapel nach einem der Ansprüche 17 und 18, **dadurch gekennzeichnet, dass** im Wesentlichen jeder Vorsprung (31) eine Länge hat, die wesentlich kürzer ist als der Abstand zwischen dem primären Durchgangsloch (21) und dem zentralen Wärmeübertragungsbereich (18) entlang der Richtung des Vorsprungs (31).

20. Plattenstapel nach einem der Ansprüche 17 bis 19, **dadurch gekennzeichnet, dass** sich im Wesentlichen jede Vertiefung (32) im Wesentlichen senkrecht zur jeweiligen Richtung eines benachbarten Vorsprungs (31) erstreckt.

21. Plattenstapel nach einem der Ansprüche 17 bis 20, **dadurch gekennzeichnet, dass** sich im Wesentlichen jede Vertiefung (22) in einer jeweiligen Richtung erstreckt, die vom sekundären Durchgangsloch (23) zum zentralen Wärmeübertragungsbereich (18) verläuft.

22. Plattenstapel nach einem der Ansprüche 20 und 21, **dadurch gekennzeichnet, dass** im Wesentlichen jede Vertiefung (32) eine Länge hat, die wesentlich kürzer ist als der Abstand zwischen dem primären Durchgangsloch (21) und dem zentralen Wärmeübertragungsbereich (18) entlang der Richtung der Vertiefung (32).

23. Plattenstapel nach einem der Ansprüche 17 bis 22, **dadurch gekennzeichnet, dass** jeder Vorsprung (31) und jede Vertiefung (32) zwei Enden und zwei Längsseiten haben, wobei sich im Wesentlichen jeder Vorsprung (31), der sich auf dem Sekundärteil (12) befindet, mit einem der Enden zu einer der Längsseiten einer Vertiefung (32) erstreckt und wobei sich im Wesentlichen jede Vertiefung (32), die sich auf dem Primärteil (21) befindet, mit einem der Enden zu einer der Längsseiten eines Vorsprungs (31) erstreckt.

24. Plattenstapel nach einem der Ansprüche 17 bis 23, **dadurch gekennzeichnet, dass** die Wärmetauschplatten (1) in einer alternierenden Reihenfolge auf eine solche Weise angeordnet sind, dass der Primärteil (11) im ersten Endbereich (16) einer ersten Wärmetauschplatte (1) an den Sekundärteil (12) einer benachbarten zweiten Wärmetauschplatte (1) angrenzt, wobei im Wesentlichen jede Vertiefung (32) der ersten Wärmetauschplatte (1) an einem Vorsprung (31) der benachbarten zweiten Wärmetauschplatte (1) anliegt.

25. Plattenstapel nach einem der Ansprüche 14 bis 24, **dadurch gekennzeichnet, dass** im Wesentlichen alle Wärmetauschplatten (1) identisch sind.

26. Plattenstapel nach einem der Ansprüche 14 bis 25, **dadurch gekennzeichnet, dass** die Wärmetauschplatten (1) dauerhaft miteinander verbunden sind.

Revendications

1. Plaque d'échangeur thermique pour un bloc de plaques (2) pour un échangeur thermique à plaque, dans laquelle la plaque d'échangeur thermique (1) s'étend entre une zone de bord principale (11a) et une zone de bord secondaire (12a) en parallèle à un plan d'extension central (13), un plan de plaque supérieur (14) et un plan de plaque inférieur (15), dans laquelle le plan d'extension central contient un axe central (x) divisant la plaque d'échangeur thermique (1) en une partie principale (11) et une partie secondaire (12) et dans laquelle la plaque d'échangeur thermique contient une première zone d'extrémité (16),
une seconde zone d'extrémité (17),
une zone de transfert thermique centrale (18) qui s'étend entre la zone de bord principale (11a) et la zone de bord secondaire (12a) de la première zone d'extrémité (16) à la seconde zone d'extrémité (17),
un hublot principal (21) et un hublot secondaire (23) qui s'étendent au travers de la plaque d'échangeur thermique (1) dans la première zone d'extrémité (16) et qui sont entourés par une zone de bord contiguë respective (25), dans laquelle le hublot principal (21) est situé sur la partie principale (11) et le hublot secondaire (23) sur la partie secondaire (12), et
une zone de distribution (26) qui s'étend sur la première zone d'extrémité (16) et a une surface de base (27) s'étendant du hublot principal (21) à la zone de transfert thermique centrale (18),
caractérisée en ce que la zone de base (27) est située à un niveau supérieur à proximité du plan de plaque supérieur (14) à proximité de la zone de bord (25) du hublot principal (21) et s'abaisse successivement jusqu'à un niveau inférieur à proximité du plan de plaque inférieur (15) à proximité de la zone de bord secondaire (12a).

2. Plaque d'échangeur thermique selon la revendication 1, **caractérisée en ce que** la forme de la zone de distribution (26) a été produite par le moulage par compression de la plaque d'échangeur thermique (1).

3. Plaque d'échangeur thermique selon l'une quelconque des revendications 1 et 2, **caractérisée en ce que** la surface de base (27) s'abaisse successivement le long d'une bordure jusqu'à la zone de transfert thermique centrale (18) à partir de la proximité de la zone de bord principale (11a) jusqu'à proximité de la zone de bord secondaire (12a).

4. Plaque d'échangeur thermique selon l'une quelconque des revendications 1 à 3, **caractérisée en ce que** la surface de base (27) s'abaisse en continu du niveau supérieur au niveau inférieur.

5. Plaque d'échangeur thermique selon l'une quelconque des revendications précédentes, **caractérisée en ce que** la zone de distribution (26) et la surface de base (27) s'étendent sur essentiellement toute la première zone d'extrémité (16).

6. Plaque d'échangeur thermique selon l'une quelconque des revendications précédentes, **caractérisée en ce que** la zone de distribution (26) contient une quantité de saillies (31) et de creux (32), dans laquelle essentiellement chaque saillie (31) s'étend dans une direction respective allant du hublot principal (21) vers la zone de transfert thermique centrale (18).

7. Plaque d'échangeur thermique selon la revendication 6, **caractérisée en ce qu'**essentiellement chaque saillie (31) atteint le plan de plaque supérieur (14) et **en ce qu'**essentiellennent chaque creux (32) atteint le plan de plaque inférieur (15).

8. Plaque d'échangeur thermique selon l'une quelconque des revendications 6 et 7, **caractérisée en ce qu'**essentiellement chaque saillie (31) a une longueur qui est essentiellement plus courte que la distance entre le hublot principal (21) et la zone de transfert thermique centrale (18) le long de la direction de la saillie (31).

9. Plaque d'échangeur thermique selon l'une quelconque des revendications 7 et 8, **caractérisée en ce qu'**essentiellement chaque creux (32) s'étend essentiellement perpendiculairement à ladite direction respective d'une saillie contiguë (31).

10. Plaque d'échangeur thermique selon l'une quelconque des revendications 6 à 9, **caractérisée en ce qu'**essentiellement chaque creux (32) s'étend dans une direction respective allant du hublot secondaire (23) vers la zone de transfert thermique centrale (18).

11. Plaque d'échangeur thermique selon l'une quelconque des revendications 9 et 10, **caractérisée en ce qu'**essentiellement chaque creux (32) a une longueur qui est essentiellement plus courte que la distance entre le hublot secondaire (23) et la zone de transfert thermique centrale (18) le long de la direction du creux (32).

12. Plaque d'échangeur thermique selon l'une quelconque des revendications 6 à 11, **caractérisée en ce que** chaque saillie (31) et chaque creux (32) ont deux extrémités et deux côtés longs, dans laquelle essentiellement chaque saillie (31) qui est située sur la partie secondaire (12), s'étend avec l'une des extrémités vers l'un des longs côtés d'un creux (32) et dans laquelle essentiellement chaque creux (32) qui

est situé sur la partie principale (11), s'étend avec l'une des extrémités vers l'un des longs côtés d'une saillie (31).

13. Plaque d'échangeur thermique selon l'une quelconque des revendications 6 à 12, **caractérisée en ce que** la plaque d'échangeur thermique (1) est symétrique par rapport à l'axe central (x) de telle manière qu'essentiellement chaque creux (32) ait une forme et une position correspondant à la forme et la position d'une saillie (31) de l'autre côté de l'axe central (x), dans laquelle chaque creux (32) est conçu pour abouter une saillie (31) d'une plaque d'échange thermique (1) tournée contiguë dans le bloc de plaques (2).

14. Bloc de plaques pour un échangeur thermique à plaque comprenant au moins deux plaques d'échangeur thermique (1) avec un espacement (40) entre les plaques, dans lequel chaque plaque d'échangeur thermique (1) s'étend entre une zone de bord principale (11a) et une zone de bord secondaire (12a) en parallèle à un plan d'extension central (13), un plan de plaque supérieur (14) et un plan de plaque inférieur (15), dans lequel le plan d'extension central (1) contient un axe central (x) divisant la plaque d'échangeur thermique (1) en une partie principale (11) et une partie secondaire (12) et dans lequel la plaque d'échangeur thermique contient une première zone d'extrémité (16),
une seconde zone d'extrémité (17),
une zone de transfert thermique centrale (18) qui s'étend entre la zone de bord principale (11a) et la zone de bord secondaire (12a) de la première zone d'extrémité (16) à la seconde zone d'extrémité (17),
un hublot principal (21) et un hublot secondaire (23) qui s'étendent au travers de la plaque d'échangeur thermique (1) dans la première zone d'extrémité (16) et qui sont entourés par une zone de bord contiguë respective (25), dans lequel le hublot principal (21) est situé sur la partie principale (11) et le hublot (23) secondaire sur la partie secondaire (12), et
une zone de distribution (26) qui s'étend sur la première zone d'extrémité (16) et a une surface de base (27) s'étendant du hublot principal (21) à la zone de transfert thermique centrale (18),
caractérisé en ce que la zone de base (27) est située à un niveau supérieur à proximité du plan de plaque supérieur (14) à proximité de la zone de bord (25) du hublot principal (21) et s'abaisse successivement jusqu'à un niveau inférieur à proximité du plan de plaque inférieur (15) à proximité de la zone de bord secondaire (12a).

15. Bloc de plaques selon la revendication 14, **caractérisé en ce que** les plaques d'échangeur thermique (1) sont disposées en alternance de telle manière que la partie principale (11) dans la première zone d'extrémité (16) d'une première plaque d'échangeur thermique (1) soit attenante à la partie secondaire d'une seconde plaque d'échangeur thermique contiguë (1), dans lequel la hauteur de l'espacement (40) entre les plaques diminue successivement d'à proximité de la zone de bord (25) du hublot principal (21) par rapport à la plaque d'échangeur thermique (1) jusqu'à proximité de la zone de bord secondaire (12a) par rapport à la première plaque d'échangeur thermique (1).

16. Bloc de plaques selon la revendication 15, **caractérisé en ce que** la hauteur de l'espacement (40) entre les plaques diminue en continu.

17. Bloc de plaques selon l'une quelconque des revendications 14 à 16, **caractérisé en ce que** la zone de distribution (26) comporte une quantité de saillies (31) et de creux (32), dans lequel essentiellement chaque saillie (31) s'étend dans une direction respective allant du hublot principal (21) vers la zone de transfert thermique centrale (18).

18. Bloc de plaques selon la revendication 17, **caractérisé en ce qu'**essentiellement chaque saillie (31) atteint le plan de plaque supérieur (14) et **en ce qu'**essentiellement chaque creux (32) atteint le plan de plaque inférieur (15).

19. Bloc de plaques selon l'une quelconque des revendications 17 et 18, **caractérisé en ce qu'**essentiellement chaque saillie (31) a une longueur qui est essentiellement plus courte que la distance entre le hublot principal (21) et la zone de transfert thermique centrale (18) le long de la direction de la saillie (31).

20. Bloc de plaques selon l'une quelconque des revendications 17 à 19, **caractérisé en ce qu'**essentiellement chaque creux (32) s'étend essentiellement perpendiculairement à ladite direction respective d'une saillie contiguë (31).

21. Bloc de plaques selon l'une quelconque des revendications 17 à 20, **caractérisé en ce qu'**essentiellement chaque creux (32) s'étend dans une direction respective allant du hublot secondaire (23) vers la zone de transfert thermique centrale (18).

22. Bloc de plaques selon l'une quelconque des revendications 20 et 21, **caractérisé en ce qu'**essentiellement chaque creux (32) a une longueur qui est essentiellement plus courte que la distance entre le hublot principal (21) et la zone de transfert thermique centrale (18) le long de la direction du creux (32).

23. Bloc de plaques selon l'une quelconque des revendications 17 à 22, **caractérisé en ce que** chaque saillie (31) et chaque creux (32) ont deux extrémités

et deux côtés longs, dans lequel essentiellement chaque saillie (31) qui est située sur la partie secondaire (12), s'étend avec l'une des extrémités vers l'un des longs côtés d'un creux (32) et dans lequel essentiellement chaque creux (32) qui est situé sur la partie principale (11), s'étend avec l'une des extrémités vers l'un des longs côtés d'une saillie (31).

24. Bloc de plaques selon l'une quelconque des revendications 17 à 23, **caractérisé en ce que** les plaques d'échangeur thermique (1) sont disposées en alternance de telle manière que la partie principale (11) dans la première zone d'extrémité (16) d'une première plaque d'échangeur thermique (1) soit attenante à la partie secondaire (12) d'une seconde plaque d'échangeur thermique (1) contiguë, dans lequel essentiellement chaque creux (32) de la première plaque d'échangeur thermique (1) aboute une saillie (31) de la seconde plaque d'échangeur thermique contiguë (1).

25. Bloc de plaques selon l'une quelconque des revendications 14 à 24, **caractérisé en ce qu'**essentiellement toutes les plaques d'échangeur thermique (1) sont identiques.

26. Bloc de plaques selon l'une quelconque des revendications 14 à 25, **caractérisé en ce que** les plaques d'échangeur thermique (1) sont en permanence unies les unes aux autres.
