(54) **Selvage device in loom**

(57) A selvage device (10) in a loom has a rotary member (26, 60) provided with guides (26a, 60a) for guiding selvage yarns (ST), and rotates the rotary member to move the selvage yarns in a shedding motion. The selvage device includes a selvage shedding mechanism (20) having the rotary member and a designated driving motor (24) that rotates the rotary member unidirectionally in an intermittent fashion; and a selvage feeding mechanism (30) disposed upstream of the selvage shedding mechanism in a traveling direction of the selvage yarns.

The selvage feeding mechanism includes a guide unit having a pair of guide portions (46a, 47a, 45a, 45b) for guiding the selvage yarns respectively fed from a pair of yarn feeders; and a rotating unit supporting the guide unit and rotated continuously in the same rotational direction as the rotary member. The guide portions revolve in response to the rotation of the rotating unit, such that sections of the selvage yarns extending from the yarn feeders to the corresponding guide portions revolve without intercrossing each other.

**ANNEX TO THE EUROPEAN SEARCH REPORT
ON EUROPEAN PATENT APPLICATION NO.**

EP 06 00 6887

This annex lists the patent family members relating to the patent documents cited in the above-mentioned European search report. The members are as contained in the European Patent Office EDP file on
The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
