(54) Lenticular calendar

(57) It is constituted on the basis of a laminar body (1), made of plastic, which in at least one of its faces incorporates parallel lenses (2) which offer two image viewing surfaces (4) and (6), depending on the respective and different points of observation (3) and (5), in other words, as a function of the relative position between the calendar and the observer, two different images can be

seen of the same calendar. This enables, for example, the same calendar to have the feast days corresponding to two different regions, even with legends in their respective languages, and consequently any person can at all times monitor the feast days of his or her own region and know when necessary how the feast days are distributed in another region with which he or she has some kind of relation.
