(54) **Door with flexible opening**

(57) A new door with flexible opening consisting of two or more vertical panels positioned side by side, two of which are interconnected by a laminar strip element, preferably extending throughout almost the whole height of the two panels. The outer edge of one of said panels is fixed to the structure or side of the wardrobe by means of the known hinges. When a pair of doors fitted on the

wardrobe is in the closed position, the surface of all the panels of the two doors is substantially continuous. To access the inner compartment of the wardrobe, the flexible door is simply pushed in a position normally corresponding to the handle. The consequent partial inward flexion of the edge of the door gives access to the space immediately behind the edge of the rigid door so that it can be pulled in the opening direction.
