(54) **A refrigerated module for dispensing ice-creams, deep-frozen products and the like**

(57) The module (13) comprises a container (14) with an internal evaporator (26) and a front opening (15) with which a motor-driven closing door (16) is associated. A recessed space (28) is formed inside the container (14) and contains at least one shelf or drawer type dispenser (106) having, defined internally, a plurality of parallel compartments (107) able to receive refrigerated products such as ice-cream and the like and provided with respective motor-driven devices (108) which can be operated in a controlled manner so as to cause dispensing by

means of gravity of a product via the opening (15).

The door (16) can be opened in a motorized manner through a first predetermined angular amplitude and can be also opened manually through a second angular amplitude, which is greater than said first amplitude, owing to disengagement of an actuating connecting bar (22) from the door (16). The arrangement is such that the door (16) can be automatically engaged again with the connecting bar (22) as a result of the door (16) being manually closed again.

**FIG.3**
