(54) **Package with retainment means**

(57) The invention relates to packages (1) of a fibrous material for receiving frangible products such as eggs, the packages being provided with a bottom part (2) and a cover part (3) hingedly connected to the bottom part (2) and specifically to various retainment means for releasably retaining the cover part (3) to the bottom part (2) in a simple, yet reliable manner. According to the invention there is thus provided retainment means on the cover part (3) for engagement with appropriate parts of an upper flange-like rim portion (6) of the bottom part (2), said means according to one embodiment consisting of

protrusions (7) provided on the inner surface of the front side of the cover part (3). When the cover part (3) from an open position is swung to a closed position on the bottom part (2), one or more protrusions (7) on the cover part (3) are brought into engagement with the lower surface of said upper rim portion (6) of the bottom part (2), thereby releasably retaining the cover part (3) to the bottom part (2). The alternative possibility, i.e. the provision of appropriate protrusions on the upper edge region of the bottom part for engagement for instance with suitably shaped openings in the cover part is also described.
