(54) **Shutter device**

(57) A shutter device includes a plurality of fins (2) almost parallel, each having at least two elongate longitudinal sides ending in correspondence of the side ends (3).

Such fins are reciprocally connected and movable between end conditions of closing and opening of the window, door or passage to which the shutter device (1) is associated.

The connection between the fins (2) is made by means of connecting levers (4) each rotatingly centrally connected to a middle portion of a fin (2) and having the two opposite ends respectively connected, in rotating way, to opposed portions of the fins (2) contiguous to the fin (2) to which the lever (4) is centrally connected. Thus, such fins (2) and levers (4) carry out a reciprocal pantograph connection.

ANNEX TO THE EUROPEAN SEARCH REPORT
ON EUROPEAN PATENT APPLICATION NO.

EP 08 16 1124

This annex lists the patent family members relating to the patent documents cited in the above-mentioned European search report.
The members are as contained in the European Patent Office EDP file on
The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
