(54) **Tilting roller blind with guides, especially for roof windows**

(57) The flexible screen (2) of the roller blind, with the end fixed in the sliding beam (21) and having on both edges the sliding tapes (7) guided in slidable guiding inserts (6) located in the guide (3) which guides the sliding beam (21). When the flexible screen (2) moves out from its casing, the sliding beam (21) is driven by the cords (8) extending from this beam to return pulleys located at the ends of the guide and then through the angular channel (35) to the reels located in the casing. The guide (3) connects with the window sash (42) through the slide (37) which moves inside the tilting guide (36) and through the pin (44) operating together with it, seated in the cover plate (45) affixed to the lower corner of the window sash. The roller blind casing is mounted in a tilting manner, and the shaft designed for winding the flexible screen is coaxial with the axis of rotation of the entire casing and guides. Moreover, the rewinding shaft is provided in the casing and located on the same side of casing on which the flexible screen moves out from the casing.

**ANNEX TO THE EUROPEAN SEARCH REPORT
ON EUROPEAN PATENT APPLICATION NO.**

EP 13 00 4211

This annex lists the patent family members relating to the patent documents cited in the above-mentioned European search report.
The members are as contained in the European Patent Office EDP file on
The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
