Description

[0001] The present invention relates to organic compounds useful for therapy and/or prophylaxis in a mammal, and in particular to compounds that are preferential agonists of the Cannabinoid Receptor 2. The compound of formula (I) is particularly useful in the treatment or prophylaxis of e.g. pain, in particular chronic pain, atherosclerosis, regulation of bone mass, inflammation, ischemia, reperfusion injury, systemic fibrosis, liver fibrosis, lung fibrosis, kidney fibrosis, chronic allograft nephropathy, congestive heart failure, myocardial infarction, systemic sclerosis, glomerulonephropathy, thermal injury, burning, hypertrophic scars, keloids, gingivitis pyrexia, liver cirrhosis or tumors.

[0002] The cannabinoid receptors are a class of cell membrane receptors belonging to the G protein-coupled receptor superfamily. There are currently two known subtypes, termed Cannabinoid Receptor 1 (CB1) and Cannabinoid Receptor 2 (CB2). The CB1 receptor is mainly expressed in the central nervous (i.e. amygdala cerebellum, hippocampus) system and to a lesser amount in the periphery. CB2, which is encoded by the CNR2 gene, is mostly expressed peripherally, on cells of the immune system, such as macrophages and T-cells (Ashton, J. C. et al. *Curr Neuropharmacol* 2007, 5(2), 73-80; Miller, A. M. et al. *Br J Pharmacol* 2008, 153(2), 299-308; Centonze, D., et al. *Curr Pharm Des* 2008, 14(23), 2370-42), and in the gastrointestinal system (Wright, K. L. et al. *Br J Pharmacol* 2008, 153(2), 263-70). The CB2 receptor is also widely distributed in the brain where it is found primarily on microglia and not neurons (Cabral, G. A. et al. *Br J Pharmacol* 2008, 153(2): 240-51).

[0003] The interest in CB2 receptor agonists has been steadily on the rise during the last decade (currently 30-40 patent applications/year) due to the fact that several of the early compounds have been shown to have beneficial effects in pre-clinical models for a number of human diseases including chronic pain (Beltramo, M. *Mini Rev Med Chem* 2009, 9(1), 11-25), atherosclerosis (Mach, F. et al. *J Neuroendocrinol* 2008, 20 Suppl 1, 53-7), regulation of bone mass (Bab, I. et al. *Br J Pharmacol* 2008, 153(2), 182-8), neuroinflammation (Cabral, G. A. et al. *J Leukoc Biol* 2005, 78(6), 1192-7), ischemia/reperfusion injury (Pacher, P. et al. *Br J Pharmacol* 2008, 153(2), 252-62), systemic fibrosis (Akhmetshina, A. et al. *Arthritis Rheum* 2009, 60(4), 1129-36; Garcia-Gonzalez, E. et al. *Rheumatology (Oxford)* 2009, 48(9), 1050-6), liver fibrosis (Julien, B. et al. *Gastroenterology* 2005, 128(3), 742-55; Munoz-Luque, J. et al. *J Pharmacol Exp Ther* 2008, 324(2), 475-83).

[0004] Ischemia/reperfusion (I/R) injury is the principal cause of tissue damage occurring in conditions such as stroke, myocardial infarction, cardiopulmonary bypass and other vascular surgeries, and organ transplantation, as well as a major mechanism of end-organ damage complicating the course of circulatory shock of various etiologies. All these conditions are characterized by a disruption of normal blood supply resulting in an insufficient tissue oxygenation. Re-oxygenation e.g., reperfusion is the ultimate treatment to restore normal tissue oxygenation. However the absence of oxygen and nutrients from blood creates a condition in which the restoration of circulation results in further tissue damage. The damage of reperfusion injury is due in part to the inflammatory response of damaged tissues. White blood cells, carried to the area by the newly returning blood, release a host of inflammatory factors such as interleukins as well as free radicals in response to tissue damage. The restored blood flow reintroduces oxygen within cells that damages cellular proteins, DNA, and the plasma membrane.

[0005] Remote ischemic preconditioning (RIPC) represents a strategy for harnessing the body's endogenous protective capabilities against the injury incurred by ischemia and reperfusion. It describes the intriguing phenomenon in which transient non-lethal ischemia and reperfusion of one organ or tissue confers resistance to a subsequent episode of "lethal" ischemia reperfusion injury in a remote organ or tissue. The actual mechanism through which transient ischemia and reperfusion of an organ or tissue confers protection is currently unknown although several hypotheses have been proposed.

[0006] The humoral hypothesis proposes that the endogenous substance (such as adenosine, bradykinin, opioids, CGRP, endocannabinoids, Angiotensin I or some other as yet unidentified humoral factor) generated in the remote organ or tissue enters the blood stream and activates its respective receptor in the target tissue and thereby recruiting the various intracellular pathways of cardioprotection implicated in ischemic preconditioning.

[0007] Recent data indicates that endocannabinoids and their receptors, in particular CB2 might be involved in preconditioning and contribute to prevent reperfusion injury by downregulation of the inflammatory response (Pacher, P. et al. *Br J Pharmacol* 2008, 153(2), 252-62). Specifically, recent studies using CB2 tool agonists demonstrated the efficacy of this concept for reducing the I/R injury in the heart (Defer, N. et al. *Faseb J* 2009, 23(7), 2120-30), the brain (Zhang, M. et al. *J Cereb Blood Flow Metab* 2007, 27(7), 1387-96), the liver (Batkai, S. et al. *Faseb J* 2007, 21(8), 1788-800) and the kidney (Feizi, A. et al. *Exp Toxicol Pathol* 2008, 60(4-5), 405-10).

[0008] Moreover, over the last few years, a growing body of literature indicates that CB2 can also be of interest in sub-chronic and chronic setting. Specific upregulation of CB1 and CB2 has been shown to be associated in animal models of chronic diseases associated with fibrosis (Garcia-Gonzalez, E. et al. *Rheumatology (Oxford)* 2009, 48(9), 1050-6; Yang, Y. Y. et al. *Liver Int* 2009, 29(5), 678-85) with a relevant expression of CB2 in myofibroblasts, the cells responsible for fibrosis progression.

[0009] Activation of CB2 receptor by selective CB2 agonist has in fact been shown to exert anti-fibrotic effect in diffuse

systemic sclerosis (Garcia-Gonzalez, E. et al. Rheumatology (Oxford) 2009, 48(9), 1050-6) and CB2 receptor has emerged as a critical target in experimental dermal fibrosis (Akhmetshina, A. et al. Arthritis Rheum 2009, 60(4), 1129-36) and in liver pathophysiology, including fibrogenesis associated with chronic liver diseases (Lotersztajn, S. et al. Gastroenterol Clin Biol 2007, 31(3), 255-8; Mallat, A. et al. Expert Opin Ther Targets 2007, 11(3), 403-9; Lotersztajn, S. et al. Br J Pharmacol 2008, 153(2), 286-9).

[0010] The compounds of the invention bind to and modulate the CB2 receptor and have lower CB1 receptor activity.

[0036] The compounds of the present invention can be prepared, for example, by the general synthetic procedures described below.

[0037] In the following schemes and description, R¹ to R⁴ have, unless otherwise indicated, the meaning of R¹ to R⁴ as defined above.

[0038] Coupling agents for the reaction of compounds of formula II with acids of formula III are for example *N,N'*-carbonyldiimidazole (CDI), *N,N'*-dicyclohexylcarbodiimide (DCC), 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDCI), 1-[bis(dimethylamino)-methylene]-1*H*-1,2,3-triazolo[4,5-*b*]pyridinium-3-oxide hexafluorophosphate (HATU), 1-hydroxy-1,2,3-benzotriazole (HOBt), O-benzotriazol-1-yl-*N,N,N',N'*-tetramethyluronium tetrafluoroborate (TBTU) or O-benzotriazole-*N,N,N',N'*-tetramethyl-uronium-hexafluoro-phosphate (HBTU). Particular coupling agent is HBTU. Suitable bases include triethylamine, diisopropylethylamine and, particularly, *N*-methylmorpholine.

[0039] The synthesis of the compounds with the general structure I can, for example, be accomplished according to

the following schemes.

[0040] Following the procedure according to scheme 1, compound **AA** ($X = \text{Cl, Br, I, trifluoromethanesulfonate}$; $R' = \text{H, methyl, ethyl, isopropyl, tert. butyl}$ or another suitable protecting group described for example in T.W. Greene et al., *Protective Groups in Organic Chemistry*, John Wiley and Sons Inc. New York 1999, 3rd edition) can be used as starting material. **AA** is either commercially available, described in the literature, can be synthesized by a person skilled in the art, can be synthesized as described in schemes 3 and 6 or as described in the experimental part.

Scheme 1

[0041] Compound **AC** can be prepared from **AA** by coupling a suitably substituted aryl, heteroaryl or alkenyl metal species of formula **AB** (step a), particularly an arylboronic acid or arylboronic acid ester in the presence of a suitable catalyst, in particular a palladium catalyst and more particularly palladium(II)acetate / triphenylphosphine mixtures or palladium(II)chloride-dppf (1,1'-bis(diphenylphosphino)ferrocene) complexes and a base such as triethylamine, sodium carbonate or potassium phosphate in an inert solvent such as dimethylformamide, toluene, tetrahydrofuran, acetonitrile and dimethoxyethane. Optionally, alkenyl containing R^1 residues can be transformed to the corresponding alkyl congeners **AC** using conditions described in the literature such as e.g. via a hydrogenation reaction using hydrogen gas in the presence of a catalyst such as palladium on carbon in a solvent such as ethanol or ethyl acetate particularly at ambient temperature.

[0042] The saponification of the ester of general formula **AC** ($R' \neq \text{H}$) by methods well known to the ones skilled in the art - using e.g. aqueous LiOH, NaOH or KOH in tetrahydrofuran / ethanol or another suitable solvent at temperatures between 0°C and the reflux temperature of the solvent employed - leads to an acid of general formula **II** (step b).

[0043] Compound **I** can be prepared from **II** and the corresponding amine or hydrazine of formula **III** by suitable amide bond forming reactions (step c). These reactions are known in the art. For example coupling reagents like *N,N'*-carbonyldiimidazole (CDI), *N,N'*-dicyclohexylcarbodiimide (DCC), 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDCI), 1-[bis(dimethylamino)-methylene]-1*H*-1,2,3-triazolo[4,5-b]pyridinium-3-oxide hexafluorophosphate (HATU), 1-hydroxy-1,2,3-benzotriazole (HOBt), *O*-benzotriazol-1-yl-*N,N,N',N'*-tetramethyluronium tetrafluoroborate (TBTU), and *O*-benzotriazole-*N,N,N',N'*-tetramethyl-uronium-hexafluoro-phosphate (HBTU) can be employed to affect such transformation. A convenient method is to use for example HBTU and a base, for example *N*-methylmorpholine in an inert solvent such as for example dimethylformamide at room temperature.

[0044] Alternatively esters of general formula **AA** ($R' \neq \text{H}$) can be saponified by methods well known to the ones skilled in the art - using e.g. aqueous LiOH, NaOH or KOH in tetrahydrofuran / ethanol or another suitable solvent at temperatures between 0°C and the reflux temperature of the solvent employed - to give acids of general formula **AD** (step b').

[0045] Compounds **AE** can be prepared from **AD** and the corresponding amine or hydrazine of formula **III** by suitable amide bond forming reactions (step c'). These reactions are known in the art. For example coupling reagents like *N,N'*-carbonyldiimidazole (CDI), *N,N'*-dicyclohexylcarbodiimide (DCC), 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDCI), 1-[bis(dimethylamino)-methylene]-1*H*-1,2,3-triazolo[4,5-b]pyridinium-3-oxide hexafluorophosphate

(HATU), 1-hydroxy-1,2,3-benzotriazole (HOBT), O-benzotriazol-1-yl-*N,N,N',N'*-tetramethyluronium tetrafluoroborate (TBTU), and O-benzotriazole-*N',N',N',N'*-tetramethyl-uronium-hexafluoro-phosphate (HBTU) can be employed to affect such transformation. A convenient method is to use for example HBTU and a base, for example *N*-methylmorpholine in an inert solvent such as for example dimethylformamide at room temperature.

[0046] Compound **I** can be prepared from **AE** by coupling a suitably substituted aryl, heteroaryl or alkenyl metal species of formula **AB** (step a'), particularly an arylboronic acid or arylboronic acid ester in the presence of a suitable catalyst, in particular a palladium catalyst and more particularly palladium(II)acetate / triphenylphosphine mixtures or palladium(II)chloride-dppf (1,1'-bis(diphenylphosphino)ferrocene) complexes and a base such as triethylamine, sodium carbonate or potassium phosphate in an inert solvent such as dimethylformamide, toluene, tetrahydrofuran, acetonitrile and dimethoxyethane. Optionally, alkenyl containing R¹ residues can be transformed to the corresponding alkyl congeners **AE** using conditions described in the literature such as e.g. via a hydrogenation reaction using hydrogen gas in the presence of a catalyst such as palladium on carbon in a solvent such as ethanol or ethyl acetate particularly at ambient temperature.

[0047] Amines or hydrazines **III** are either commercially available, described in the literature, can be synthesized by a person skilled in the art or as described in the experimental part.

[0048] If one of the starting materials, compounds of formulae **AA**, **AB** or **III**, contains one or more functional groups which are not stable or are reactive under the reaction conditions of one or more reaction steps, appropriate protecting groups (P) (as described e.g. in T.W. Greene et al., *Protective Groups in Organic Chemistry*, John Wiley and Sons Inc. New York 1999, 3rd edition) can be introduced before the critical step applying methods well known in the art. Such protecting groups can be removed at a later stage of the synthesis using standard methods known in the art.

[0049] If one or more compounds of formulae **AA** to **AE**, **II** or **III** contain chiral centers, picolines of formula **I** can be obtained as mixtures of diastereomers or enantiomers, which can be separated by methods well known in the art, e.g. (chiral) HPLC or crystallization. Racemic compounds can e.g. be separated into their antipodes via diastereomeric salts by crystallization or by separation of the antipodes by specific chromatographic methods using either a chiral adsorbent or a chiral eluent.

[0050] Following the procedure according to scheme 2, compound **BA** (R' = H, methyl, ethyl, isopropyl, tert. butyl or another suitable protecting group described for example in T.W. Greene et al., *Protective Groups in Organic Chemistry*, John Wiley and Sons Inc. New York 1999, 3rd edition) can be used as starting material. **BA** is either commercially available, described in the literature or can be synthesized by a person skilled in the art.

Scheme 2

[0051] Compound **BB** can be prepared from **BA** by oxidation with a suitable oxidizing reagent under conditions known to a person skilled in the art (step a), e.g. by treatment with 3-chloro perbenzoic acid in dichloromethane at ambient temperature.

[0052] Conversion of compound **BB** to 6-chloro or 6-bromo-picoline **AA'** (X = Cl, Br) can be achieved e.g. by treatment with phosphoryl trichloride or tribromide either without an additional solvent or in a suitable solvent such as chloroform at temperatures between 20°C and the boiling point of the solvent, or by using other conditions known in the literature (step b).

5 [0053] 6-Chloro- or bromo-picoline **AA'** (X = Cl, Br) can be transformed to compound **BD** by reaction with a suitably substituted primary or secondary alcohol **BC** in the presence of a base, for example sodium hydride, with or without an inert solvent, for example dimethylformamide, at temperatures ranging from room temperature to the reflux temperature of the solvent, particularly at room temperature (step c). Alternatively, compound **AA'** can be converted to amino derivatives **BD** by treatment with an amine **BC** applying methods well known in the art (step c), for example using a palladium promoted amination reaction with palladium(II)acetate / 2-(dicyclohexylphosphino)biphenyl as the catalyst system in the presence of a base such as potassium carbonate in dioxane under reflux conditions.

10 [0054] Compound **BD** can be further elaborated to compound **I** by: i) saponification (for compounds **BD** with R' ≠ H) as described in step b of scheme 1 (step d); ii) amide bond formation as described in step c of scheme 1 (step e).

15 [0055] Alternatively, compound **AA'** (R' = methyl, ethyl, isopropyl, tert. butyl or another suitable protecting group described for example in T.W. Greene et al., Protective Groups in Organic Chemistry, John Wiley and Sons Inc. New York 1999, 3rd edition) can be: i) converted into its acid congener **AA'** (R' = H) as described in step b of scheme 1; ii) transformed into the corresponding amide or hydrazide by treatment with amine or hydrazine **III** as described in step c of scheme 1; and iii) reacted with alcohol **BC** as described in step c to arrive at compound **I**.

20 [0056] If one of the starting materials, compounds of formulae **BA**, **BC** or **III**, contains one or more functional groups which are not stable or are reactive under the reaction conditions of one or more reaction steps, appropriate protecting groups (P) (as described e.g. in T.W. Greene et al., Protective Groups in Organic Chemistry, John Wiley and Sons Inc. New York 1999, 3rd edition) can be introduced before the critical step applying methods well known in the art. Such protecting groups can be removed at a later stage of the synthesis using standard methods known in the art.

25 [0057] If one or more compounds of formulae **BA** to **BD**, **AA'**, **II** or **III** contain chiral centers, picolines of formula **I** can be obtained as mixtures of diastereomers or enantiomers, which can be separated by methods well known in the art, e.g. (chiral) HPLC or crystallization. Racemic compounds can e.g. be separated into their antipodes via diastereomeric salts by crystallization or by separation of the antipodes by specific chromatographic methods using either a chiral adsorbent or a chiral eluent.

30 [0058] Following the procedure according to scheme 3, compound **CA** (R' = H, methyl, ethyl, isopropyl, tert. butyl or another suitable protecting group described for example in T.W. Greene et al., Protective Groups in Organic Chemistry, John Wiley and Sons Inc. New York 1999, 3rd edition) can be used as starting material. **CA** is either commercially available (e.g. for R' = methyl: 5-bromo-6-chloro-pyridine-2-carboxylic acid methyl ester CAN 1214353-79-3), described in the literature or can be synthesized by a person skilled in the art.

Scheme 3

[0059] Compound **AA''** can be prepared from **CA** by coupling a suitably substituted aryl, heteroaryl or alkenyl metal species of formula **CB** (step a), e.g. an organotrifluoroborate potassium salt in the presence of a palladium catalyst such as palladium(II)acetate / butyl-1-adamantylphosphine and a base such as cesium carbonate in an inert solvent such as toluene at temperatures between 50°C and the boiling temperature of the solvent, or an arylboronic acid or arylboronic acid ester in the presence of a suitable catalyst, in particular a palladium catalyst and more particularly palladium(II)acetate / triphenylphosphine mixtures or palladium(II)chloride-dppf (1,1'-bis(diphenylphosphino)ferrocene) complexes and a base such as triethylamine, sodium carbonate or potassium phosphate in an inert solvent such as dimethylformamide, toluene, tetrahydrofuran, acetonitrile or dimethoxyethane. Optionally, compound **CB** can also be an amine or amide which is coupled to **CA** by methods well known to a person skilled in the art, e.g. using a palladium catalyst such as tris(dibenzylideneacetone)dipalladium / dimethylbis(diphenylphosphino)oxanthene and a base such as cesium carbonate in a solvent such as 1,4-dioxane, preferentially at the boiling point of the solvent. Alternatively, compound **CB** can also be a sulfonamide which undergoes a copper(I) mediated reaction with **CA** to form **AA''** following procedures described in the literature, e.g. using copper(I) iodide and 1,3-di(pyridin-2-yl)propane-1,3-dione in the presence of a base such as potassium carbonate in a solvent such as dimethylformamide at elevated temperatures preferentially at the boiling point of the solvent. Optionally, alkenyl containing R² residues can be transformed to the corresponding alkyl congeners **AA''** using conditions described in the literature such as e.g. a hydrogenation reaction using hydrogen gas in the presence of a catalyst such as palladium on carbon in a solvent such as ethanol or ethyl acetate particularly at ambient temperature.

[0060] Compound **AA'** can be further elaborated to compound **I** by: i) reaction with compound **BC** to form compound **BD** as described in step c of scheme 2; ii) saponification as described in step b of scheme 1; and iii) amide bond formation as described in step c of scheme 1.

[0061] Furthermore, compound **CA** can be converted into compound **CC** by treatment with compound **BC** as described in step c of scheme 2 (step b).

[0062] Subsequent transformation of compound **CC** into compound **BD** can be achieved as discussed for the conversion of **CA** into **AA''** (step a).

[0063] Compound **BD** can be further elaborated to compound **I** by: i) saponification as described in step b of scheme 1; ii) amide bond formation as described in step c of scheme 1.

[0064] Alternatively, compound **CC** ($R' = \text{methyl, ethyl, isopropyl, tert. butyl}$ or another suitable protecting group described for example in T.W. Greene et al., Protective Groups in Organic Chemistry, John Wiley and Sons Inc. New York 1999, 3rd edition) can be: i) converted into its acid congener **CC** ($R' = \text{H}$) as described in step b of scheme 1; ii) transformed into the corresponding amide or hydrazide **CD** by treatment with amine or hydrazine **III** as described in step c of scheme 1; and iii) reacted with **CB** as described in step a to arrive at compound **I**.

[0065] Furthermore, compound **I** can also be synthesized applying the following reaction sequence: i) saponification of compound **CA** ($R' = \text{methyl, ethyl, isopropyl, tert. butyl}$ or another suitable protecting group described for example in T.W. Greene et al., Protective Groups in Organic Chemistry, John Wiley and Sons Inc. New York 1999, 3rd edition) to its acid congener **CC** ($R' = \text{H}$) as described in step b of scheme 1; ii) conversion to the corresponding amide or hydrazide by treatment with amine or hydrazine **III** as described in step c of scheme 1; iii) reaction with compound **CB** as described in step a; and iv) reaction with compound **BC** as described in step c. Optionally step iii) and step iv) can be interchanged.

[0066] If one of the starting materials, compounds of formulae **CA**, **CB** or **BC** contains one or more functional groups which are not stable or are reactive under the reaction conditions of one or more reaction steps, appropriate protecting groups (P) (as described e.g. in T.W. Greene et al., Protective Groups in Organic Chemistry, John Wiley and Sons Inc. New York 1999, 3rd edition) can be introduced before the critical step applying methods well known in the art. Such protecting groups can be removed at a later stage of the synthesis using standard methods known in the art.

[0067] If one or more compounds of formulae **CA**, **CB** or **BC** contain chiral centers, picolines of formula **AA''** and **BD** can be obtained as mixtures of diastereomers or enantiomers, which can be separated by methods well known in the art, e.g. (chiral) HPLC or crystallization. Racemic compounds can e.g. be separated into their antipodes via diastereomeric salts by crystallization or by separation of the antipodes by specific chromatographic methods using either a chiral adsorbent or a chiral eluent.

[0068] Following the procedure according to scheme 4, compound **CC** ($R' = \text{H, methyl, ethyl, isopropyl, tert. butyl}$ or another suitable protecting group described for example in T.W. Greene et al., Protective Groups in Organic Chemistry, John Wiley and Sons Inc. New York 1999, 3rd edition) can be used as starting material. **CC** is either commercially available, described in the literature, can be synthesized by methods described in scheme 3 or by other methods known to a person skilled in the art.

Scheme 4

[0069] Compound **BD** can be prepared from **CC** by coupling a suitably substituted aryl, heteroaryl or alkenyl metal species of formula **CB** (step a), e.g. an organotrifluoroborate potassium salt in the presence of a palladium catalyst such

as palladium(II)acetate / butyl-1-adamantylphosphine and a base such as cesium carbonate in an inert solvent such as toluene at temperatures between 50°C and the boiling temperature of the solvent, or an arylboronic acid or arylboronic acid ester in the presence of a suitable catalyst, in particular a palladium catalyst and more particularly palladium(II)acetate / triphenylphosphine mixtures or palladium(II)chloride-dppf (1,1'-bis(diphenylphosphino)ferrocene) complexes and a base such as triethylamine, sodium carbonate or potassium phosphate in an inert solvent such as dimethylformamide, toluene, tetrahydrofuran, acetonitrile and dimethoxyethane. Optionally, alkenyl containing R² residues can be transformed to the corresponding alkyl congeners **BD** using conditions described in the literature such as e.g. a hydrogenation reaction using hydrogen gas in the presence of a catalyst such as palladium on carbon in a solvent such as ethanol or ethyl acetate particularly at ambient temperature.

[0070] Alternatively, compound **CC** can be converted to amino derivatives **BD** by treatment with an amine **BC** applying methods well known in the art (step b), for example using a palladium promoted amination with palladium(II)acetate / 2-(dicyclohexylphosphino) biphenyl in the presence of a base such as potassium carbonate in dioxane under reflux conditions or by using tris(dibenzylideneacetone)dipalladium / rac-BINAP (2,2'-bis(diphenylphosphino)-1,1'-binaphthyl) in the presence of a base such as cesium carbonate in toluene at 100°C. Optionally, compound **BC** can also be an amide which is coupled to **CC** by methods well known to a person skilled in the art, e.g. using a palladium catalyst such as tris(dibenzylideneacetone)dipalladium / dimethylbis(diphenyl)-phosphinoxanthene and a base such as cesium carbonate in a solvent such as 1,4-dioxane preferentially at the boiling point of the solvent.

[0071] Compound **CC** can furthermore be reacted with ketone **DA** (R² = alkyl, cycloalkyl, or oxyoxetanyl) to obtain compound **BD** following procedures known to a person skilled in the art, e.g.: i) treatment with *n*-butyl lithium in a solvent such as tetrahydrofuran at a temperature of -78°C; ii) addition of a ketone **DA** or optionally another suitable electrophile at temperatures between -78°C and ambient temperature (step c).

[0072] Compound **BD** can be further elaborated to compound **I** by: i) saponification as described in step b of scheme 1; ii) amide bond formation as described in step c of scheme 1.

[0073] If one of the starting materials, compounds of formulae **CC**, **CB**, **BC** or **DA**, contains one or more functional groups which are not stable or are reactive under the reaction conditions of one or more reaction steps, appropriate protecting groups (P) (as described e.g. in T.W. Greene et al., Protective Groups in Organic Chemistry, John Wiley and Sons Inc. New York 1999, 3rd edition) can be introduced before the critical step applying methods well known in the art. Such protecting groups can be removed at a later stage of the synthesis using standard methods known in the art.

[0074] If one or more compounds of formulae **CC**, **CB**, **BC** or **DA**, contain chiral centers, picolines of formula **BD** can be obtained as mixtures of diastereomers or enantiomers, which can be separated by methods well known in the art, e.g. (chiral) HPLC or crystallization. Racemic compounds can e.g. be separated into their antipodes via diastereomeric salts by crystallization or by separation of the antipodes by specific chromatographic methods using either a chiral adsorbent or a chiral eluent.

[0075] Following the procedure according to scheme 5, compound **AA''** (R' = H) can be used as starting material. **AA''** is either commercially available, described in the literature, can be synthesized as described in scheme 2 or by other methods known to a person skilled in the art.

[0077] Subsequent esterification of **EA** to compound **EB** ($R' =$ methyl, ethyl, isopropyl, tert. butyl or another suitable protecting group (P) as described e.g. in T.W. Greene et al., Protective Groups in Organic Chemistry, John Wiley and Sons Inc. New York 1999, 3rd edition) can e.g. be performed using a solution of hydrogen chloride in methanol at ambient temperature or by alternative methods described for example in T.W. Greene et al., Protective Groups in Organic Chemistry, John Wiley and Sons Inc. New York 1999, 3rd edition (step b).

[0078] Sulfonic acid **EB** can be converted to sulfonamide **ED**, after prior activation e.g. by using thionyl chloride and DMF in an inert solvent such as dichloromethane at temperatures between 0°C and the boiling point of the solvent, particularly at 40°C to form the corresponding sulfonic acid chloride, by reaction with a suitable amine **EC** ($R^{1''} =$ alkyl, $R^{1'} =$ alkyl or $R^{1'}$ and $R^{1''}$ together with the nitrogen atom to which they are attached form a cyclic amine) particularly at ambient temperature or by using any other method known to a person skilled in the art (step c).

[0079] Compound **ED** can be further elaborated to compound **I** by: i) saponification as described in step b of scheme 1 (step d); ii) amide bond formation as described in step c of scheme 1 (step e).

[0080] If one of the starting materials, compounds of formulae **AA''**, **EC** or **III**, contains one or more functional groups which are not stable or are reactive under the reaction conditions of one or more reaction steps, appropriate protecting groups (P) (as described e.g. in T.W. Greene et al., Protective Groups in Organic Chemistry, John Wiley and Sons Inc. New York 1999, 3rd edition) can be introduced before the critical step applying methods well known in the art. Such protecting groups can be removed at a later stage of the synthesis using standard methods known in the art.

[0081] If one or more compounds of formulae **AA''**, **EA** to **ED**, **II** or **III** contain chiral centers, picolines of formula **I** can be obtained as mixtures of diastereomers or enantiomers, which can be separated by methods well known in the art, e.g. (chiral) HPLC or crystallization. Racemic compounds can e.g. be separated into their antipodes via diastereomeric salts by crystallization or by separation of the antipodes by specific chromatographic methods using either a chiral adsorbent or a chiral eluent.

[0082] Following the procedure according to scheme 6, compound **FA** ($X =$ Cl, Br, I, trifluoromethanesulfonate; $R' =$ H, methyl, ethyl, isopropyl, tert. butyl or another suitable protecting group described for example in T.W. New York 1999, 3rd edition) can be used as starting material. **FA** is either commercially available, described in the literature or can be synthesized by a person skilled in the art.

Scheme 6

[0083] Compound **BA** can be prepared from **FA** by coupling a suitably substituted aryl, heteroaryl or alkenyl metal species of formula **CB** (step a), e.g. an organotrifluoroborate potassium salt in the presence of a palladium catalyst such as palladium(II)acetate / butyl-1-adamantylphosphine and a base such as cesium carbonate in an inert solvent such as toluene at temperatures between 50°C and the boiling temperature of the solvent, or an arylboronic acid or arylboronic acid ester in the presence of a suitable catalyst, in particular a palladium catalyst and more particularly palladium(II)acetate / triphenylphosphine mixtures or palladium(II)chloride-dppf (1,1'-bis(diphenylphosphino)ferrocene) complexes and a base such as triethylamine, sodium carbonate or potassium phosphate in an inert solvent such as dimethylformamide, toluene, tetrahydrofuran, acetonitrile and dimethoxyethane. Optionally, compound **CB** can also be an amine or amide which is coupled to **FA** by methods well known to a person skilled in the art, e.g. using a palladium catalyst such as tris(dibenzylideneacetone)dipalladium / dimethylbis(diphenylphosphino)xanthene and a base such as cesium carbonate in a solvent such as 1,4-dioxane preferentially at the boiling point of the solvent. Optionally, alkenyl containing R^2 residues can be transformed to the corresponding alkyl congeners **BA** using conditions described in the literature such as e.g. a hydrogenation reaction using hydrogen gas in the presence of a catalyst such as palladium on carbon in a solvent such as ethanol or ethyl acetate particularly at ambient temperature.

[0084] Compound **BB** can be prepared from **BA** by oxidation with a suitable oxidizing reagent as described in step a of scheme 2 (step b).

[0085] Conversion of compound **BB** to 6-chloro- or 6-bromo-picoline **AA'** ($X = Cl, Br$) can be achieved as described in step b of scheme 2 (step c).

[0087] Compound **AC** can be further elaborated to compound **I** by: i) saponification as described in step b of scheme 1 (step e); ii) amide bond formation as described in step c of scheme 1 (step f).

[0088] If one of the starting materials, compounds of formulae **FA**, **CB**, **AB** or **III**, contains one or more functional groups which are not stable or are reactive under the reaction conditions of one or more reaction steps, appropriate protecting groups (P) (as described e.g. in T.W. Scheme 7

[0091] Compound **GB** can be prepared from **GA** by oxidation with a suitable oxidizing reagent under conditions known to a person skilled in the art (step a), e.g. by treatment with 3-chloro perbenzoic acid in dichloromethane at ambient temperature.

[0092] Conversion of compound **GB** to 6-chloro or 6-bromo compound **GC** (X = Cl, Br) can be achieved e.g. by treatment with phosphoryl trichloride or tribromide either without an additional solvent or in a suitable solvent such as chloroform at temperatures between 20°C and the boiling point of the solvent or by using other conditions known in the literature (step b).

[0093] Hydrolysis of compound **GC** leads to picoline **GD** and can be performed under acidic or basic conditions known to a person skilled in the art, e.g. by treatment with an aqueous solution of sodium hydroxide at 100°C (step c).

[0094] Compound **II** can be prepared from **GD** by coupling a suitably substituted aryl, heteroaryl or alkenyl metal species of formula **AB** (step d) as described in step d of scheme 6. Optionally, alkenyl containing R¹ residues can be transformed to the corresponding alkyl congeners **II** using conditions described in the literature such as e.g. a hydrogenation reaction using hydrogen gas in the presence of a catalyst such as palladium on carbon in a solvent such as ethanol or ethyl acetate particularly at ambient temperature. In cases where the acid group of compound **GD** is not compatible with the conditions applied to introduce the R¹ residue, suitable protecting groups such as ester protecting groups e.g. a methyl ester can be introduced prior to step d and removed at a later point of the synthesis. Protecting group introduction and removal can be carried out by suitable methods known in the art (for more details see T.W. Greene et al., Protective Groups in Organic Chemistry, John Wiley and Sons Inc. New York 1999, 3rd edition).

[0095] Further conversion of compound **II** to compound **I** can be done by applying amide bond formation conditions as depicted in step c of scheme 1 (step e).

[0096] If one of the starting materials, compounds of formulae **GA**, **AB** or **III**, contains one or more functional groups which are not stable or are reactive under the reaction conditions of one or more reaction steps, appropriate protecting groups (P) (as described e.g. in T.W. Greene et al., Protective Groups in Organic Chemistry, John Wiley and Sons Inc. New York 1999, 3rd edition) can be introduced before the critical step applying methods well known in the art. Such protecting groups can be removed at a later stage of the synthesis using standard methods known in the art.

[0097] If one or more compounds of formulae **GA**, to **GD**, **AB**, **II** or **III** contain chiral centers, picolines of formula **I** can be obtained as mixtures of diastereomers or enantiomers, which can be separated by methods well known in the art, e.g. (chiral) HPLC or crystallization. Racemic compounds can e.g. be separated into their antipodes via diastereomeric salts by crystallization or by separation of the antipodes by specific chromatographic methods using either a chiral adsorbent or a chiral eluent.

[0098] Following the procedure according to scheme 8, compound **HA** can be used as starting material (R^{10} = hydrogen or alkyl; R^{11} = hydrogen or alkyl). **HA** is either commercially available, described in the literature or can be synthesized by a person skilled in the art.

Scheme 8

[0099] Compound **HC** can be prepared from **HA** applying methods described in the literature, e.g. by treatment with methyl propiolate in ammonia at elevated temperatures in an autoclave (step a).

[0100] Conversion of compound **HC** to **HD** can be performed e.g. using trifluoromethanesulfonic acid anhydride in the presence of a base such as triethylamine in a solvent such as dichloromethane at temperatures preferentially between $-50^{\circ}C$ and ambient temperature or applying any other suitable method known to the ones skilled in the art (step b). Alternatively, other groups than trifluoromethane sulfonate suitable for the transformation of **HD** to **HE** can be introduced following procedures described in the literature.

[0101] Compound **HE** (R' = methyl, ethyl, isopropyl, tert. butyl or another suitable protecting group) can be synthesized from **HD** via palladium catalyzed carbonylation using a palladium catalyst such as palladium(II)chloride-dppf (1,1'-bis(diphenylphosphino)ferrocene) complexes under a carbon monoxide atmosphere preferentially under pressures of 70 bar in the presence of an amine such as triethylamine in a solvent system consisting e.g. of methanol and ethyl acetate at elevated temperatures (step c).

[0102] Compound **HE** can be further elaborated to compound **I** by: i) saponification as described in step b of scheme 1 (step d); ii) amide bond formation as described in step c of scheme 1 (step e).

[0103] If one of the starting materials, compounds of formulae **HA** or **III**, contains one or more functional groups which are not stable or are reactive under the reaction conditions of one or more reaction steps, appropriate protecting groups (P) (as described e.g. in T.W. Greene et al., Protective Groups in Organic Chemistry, John Wiley and Sons Inc. New York 1999, 3rd edition) can be introduced before the critical step applying methods well known in the art. Such protecting groups can be removed at a later stage of the synthesis using standard methods known in the art.

[0104] If one or more compounds of formulae **HA**, **HC** to **HE**, **II** or **III** contain chiral centers, picolines of formula **I** can be obtained as mixtures of diastereomers or enantiomers, which can be separated by methods well known in the art, e.g. (chiral) HPLC or crystallization. Racemic compounds can e.g. be separated into their antipodes via diastereomeric salts by crystallization or by separation of the antipodes by specific chromatographic methods using either a chiral adsorbent or a chiral eluent.

[0105] Following the procedure according to scheme 9, commercially available 5-bromo-6-methyl-pyridine-2-carbonitrile **IA** (CAN 1173897-86-3) can be used as starting material. In scheme 9, R^1 is benzyl or halobenzyl; R^1 is phenyl or haloheptyl.

Scheme 9

[0106] Compound **IB** can be prepared from **IA** by treatment with compound **CB** as described in step a of scheme 6 (step a).

[0107] Further transformation of **IB** to **IC** can be achieved by oxidation with a suitable oxidizing reagent as described in step a of scheme 7 (step b).

[0108] Conversion of *N*-oxide **IC** to alcohol **ID** can be performed under conditions well known to a person skilled in the art, e.g. by reaction with trifluoroacetic acid anhydride in a solvent such as dichloromethane preferentially at ambient temperature and subsequent treatment with a base such as sodium hydroxide (step c).

[0109] Reactions how to convert alcohol **ID** into compound **IE** containing a leaving group ($Y = \text{Cl}, \text{Br}$ or another suitable leaving group) are well described in the literature and known to those skilled in the art (step d). For example alcohol **ID** can be transformed to compound **IE** with $Y = \text{Br}$ by reaction with carbon tetrabromide and triphenylphosphine in a solvent such as tetrahydrofuran at temperatures between 0°C and the boiling point of the solvent, preferentially at 40°C .

[0110] Conversion of compound **IE** to compound **IF** can e.g. be accomplished by coupling a suitably substituted aryl metal species of formula **AB'**, particularly an arylboronic acid or arylboronic acid ester in the presence of a suitable catalyst, in particular a palladium catalyst and more particularly palladium(II)acetate / triphenylphosphine mixtures or palladium(II)chloride-dppf (1,1'-bis(diphenylphosphino)ferrocene) complexes and a base such as triethylamine, cesium carbonate or potassium phosphate in an inert solvent such as dimethylformamide, toluene, tetrahydrofuran and 1,4-dioxane (step e).

[0111] Nitrile **IF** can be hydrolyzed to acid **II** applying the method described in step c of scheme 7 (step f).

[0112] Further conversion of compound **II** to compound **I** can be done by applying amide bond formation conditions as depicted in step c of scheme 1 (step e).

[0113] If one of the starting materials, compounds of formulae **IA**, **CB**, **AB'** or **III**, contains one or more functional groups which are not stable or are reactive under the reaction conditions of one or more reaction steps, appropriate protecting groups (P) (as described e.g. in T.W. Greene et al., *Protective Groups in Organic Chemistry*, John Wiley and Sons Inc. New York 1999, 3rd edition) can be introduced before the critical step applying methods well known in the art. Such protecting groups can be removed at a later stage of the synthesis using standard methods known in the art.

[0114] If one or more compounds of formulae **IA** to **IF**, **CB**, **AB'**, **II** or **III** contain chiral centers, picolines of formula **I** can be obtained as mixtures of diastereomers or enantiomers, which can be separated by methods well known in the art, e.g. (chiral) HPLC or crystallization. Racemic compounds can e.g. be separated into their antipodes via diastereomeric salts by crystallization or by separation of the antipodes by specific chromatographic methods using either a chiral adsorbent or a chiral eluent.

[0115] Compounds **I** may be further processed to give additional compounds of the general structure **I** by methods known in the art. Some examples are shown in scheme 10. In scheme 10, R^{12} is isobutyl, n is 0, 1 or 2.

[0116] Compounds of the general structure **KB** (a subgroup of **I**) can be prepared from compounds of general structure

KA (another subgroup of **I**) by oxidative methods well known in the art, e.g. by Swern-oxidation using DMSO and a suitable activating agent as for example oxalyl chloride in an inert solvent as for example dichloromethane in the presence of a suitable base at temperatures ranging from -70°C to room temperature.

[0117] Compounds of the general structure **KD** (a subgroup of **I**) can be prepared from compounds of general structure **KC** (another subgroup of **I**) by converting an alcohol functionality to an azide functionality by methods known in the art. This transformation can for example be affected by treating a solution of the alcohol in an inert solvent like DMF with sodium azide, triphenylphosphine and carbon tetrachloride at elevated temperatures as for example 90°C. Further elaboration to the corresponding amine **KE** is done by reduction methods well known in the art as for example by reduction with sodium borohydride in 2-propanol in the presence of 1,3-propanedithiol and triethylamine at ambient temperatures. The amines **KE** can be further transformed into compounds of general structure **KF**, by reaction with 7-nitro-2,1,3-benzoxadiazol-4-amine in an inert solvent like THF at temperatures ranging from room temperature to the boiling point of the solvent.

Scheme 10

[0118] If one of the starting materials, compounds of formulae **KA** or **KC** contains one or more functional groups which are not stable or are reactive under the reaction conditions of one or more reaction steps, appropriate protecting groups (P) (as described e.g. in T.W. Greene et al., Protective Groups in Organic Chemistry, John Wiley and Sons Inc. New York 1999, 3rd edition) can be introduced before the critical step applying methods well known in the art. Such protecting groups can be removed at a later stage of the synthesis using standard methods known in the art.

[0119] If one or more compounds of formulae **KA** or **KC** contain chiral centers, picolines of formula **I** can be obtained as mixtures of diastereomers or enantiomers, which can be separated by methods well known in the art, e.g. (chiral) HPLC or crystallization. Racemic compounds can e.g. be separated into their antipodes via diastereomeric salts by crystallization or by separation of the antipodes by specific chromatographic methods using either a chiral adsorbent or a chiral eluent.

Pharmacological tests

[1373] The following tests were carried out in order to determine the activity of the compounds of formula I:

Radioligand binding assay

[1374] The affinity of the compounds of the invention for cannabinoid CB1 receptors was determined using recommended amounts of membrane preparations (PerkinElmer) of human embryonic kidney (HEK) cells expressing the human CNR1 or CNR2 receptors in conjunction with 1.5 or 2.6 nM $[3H]$ -CP-55,940 (Perkin Elmer) as radioligand, respectively. Binding was performed in binding buffer (50 mM Tris, 5 mM $MgCl_2$, 2.5 mM EDTA, and 0.5% (wt/vol) fatty acid free BSA, pH 7.4 for CB1 receptor and 50 mM Tris, 5 mM $MgCl_2$, 2.5 mM EGTA, and 0.1% (wt/vol) fatty acid free BSA, pH 7.4 for CB2 receptor) in a total volume of 0.2 ml for 1h at 30°C shaking. The reaction was terminated by rapid filtration through microfiltration plates coated with 0.5% polyethylenimine (UniFilter GF/B filter plate; Packard). Bound radioactivity was analyzed for K_i using nonlinear regression analysis (Activity Base, ID Business Solution, Limited), with the K_d values for $[3H]$ CP55,940 determined from saturation experiments. The compounds of formula (I) show an excellent affinity for the CB2 receptor.

[1375] The compounds according to formula (I) have an activity in the above assay (K_i) between 0.5 nM and 10 μ M. Particular compounds of formula (I) have an activity in the above assay (K_i) between 0.5 nM and 3 μ M. Other particular compounds of formula (I) have an activity in the above assay (K_i) between 0.5 nM and 100 nM.

cAMP Assay

[1376] CHO cells expressing human CB1 or CB2 receptors are seeded 17-24 hours prior to the experiment 50.000 cells per well in a black 96 well plate with flat clear bottom (Corning Costar #3904) in DMEM (Invitrogen No. 31331), 1x HT supplement, with 10 % fetal calf serum and incubated at 5% CO_2 and 37°C in a humidified incubator. The growth medium was exchanged with Krebs Ringer Bicarbonate buffer with 1 mM IBMX and incubated at 30°C for 30 min. Compounds were added to a final assay volume of 100 μ l and incubated for 30 min at 30°C. Using the cAMP-NanoTRF detection kit the assay (Roche Diagnostics) was stopped by the addition of 50 μ l lysis reagent (Tris, NaCl, 1.5% Triton X100, 2.5% NP40, 10% NaN_3) and 50 μ l detection solutions (20 μ M mAb Alexa700-cAMP 1:1, and 48 μ M Ruthenium-2-AHA-cAMP) and shaken for 2h at room temperature. The time-resolved energy transfer is measured by a TRF reader (Evotec Technologies GmbH), equipped with a ND:YAG laser as excitation source. The plate is measured

twice with the excitation at 355 nm and at the emission with a delay of 100 ns and a gate of 100 ns, total exposure time 10s at 730 (bandwidth 30 nm) or 645 nm (bandwidth 75 nm), respectively. The FRET signal is calculated as follows: $FRET = T730-Alexa730-P(T645-B645)$ with $P = Ru730-B730/Ru645-B645$, where T730 is the test well measured at 730 nM, T645 is the test well measured at 645 nm, B730 and B645 are the buffer controls at 730 nm and 645 nm, respectively.

cAMP content is determined from the function of a standard curve spanning from 10 μ M to 0.13 nM cAMP.

[1377] EC_{50} values were determined using Activity Base analysis (ID Business Solution, Limited). The EC_{50} values for a wide range of cannabinoid agonists generated from this assay for reference compounds were in agreement with the values published in the scientific literature.

[1378] In the foregoing assay, the compounds according to the invention have a human CB2 EC_{50} which is between 0.5 nM and 10 μ M. Particular compounds according to the invention have a human CB2 EC_{50} between 0.5 nM and 1 μ M. Further particular compounds according to the invention have a human CB2 EC_{50} between 0.5 nM and 100 nM. They exhibit at least 10 fold selectivity against the human CB1 receptor in, either both of the radioligand and cAMP assay, or in one of these two assays.

[1379] Results obtained for representative compounds of the invention are given in the following table.

 β -Arrestin translocation assay-PathHunter™ (DiscoverX)

[1380] PathHunter™ β -arrestin CHO-K1 CNR1 cell line (catalog number #93-0200C2) and the β -arrestin CHO-K1 CNR2 cell line (catalog number #93-0706C2) were purchased from DiscoverX Corporation. The cell line was engineered to express the β -galactosidase EA fragment fused to β -arrestin and the ProLink complementary peptide fused to the target receptor. The PathHunter™ protein complementation assay (DiscoverX Corporation #93-0001) was performed according to the manufacturer's protocol. Assay plates were seeded containing 7500 (CNR1) and 10000 (CNR2) cells in 384 well plates (Corning Costar #3707, white, clear bottom) in 20 μ L cell plating reagent 2 (Discoverx #93-0563R2A). After incubation at 37°C (5% CO₂, 95% relative humidity) overnight, 5 μ L of test compound was added (1% final DMSO concentration) and the incubation continued at 30°C for 90 min. Detection reagent (12 μ L) was then added and the incubation continued at room temperature for 60 min. Plates were then analyzed for a chemiluminescent signal using a Victor ³V reader (Perkin Elmer).

Example A

[1381] Film coated tablets containing the following ingredients can be manufactured in a conventional manner:

Ingredients	Per tablet	
Kernel:		
Compound of formula (I)	10.0 mg	200.0 mg
Microcrystalline cellulose	23.5 mg	43.5 mg
Lactose hydrous	60.0 mg	70.0 mg
Povidone K30	12.5 mg	15.0 mg
Sodium starch glycolate	12.5 mg	17.0 mg
Magnesium stearate	1.5 mg	4.5 mg
(Kernel Weight)	120.0 mg	350.0 mg
Film Coat:		
Hydroxypropyl methyl cellulose	3.5 mg	7.0 mg
Polyethylene glycol 6000	0.8 mg	1.6 mg
Talc	1.3 mg	2.6 mg

(continued)

Film Coat:		
Iron oxide (yellow)	0.8 mg	1.6 mg
Titan dioxide	0.8 mg	1.6 mg

[1382] The active ingredient is sieved and mixed with microcrystalline cellulose and the mixture is granulated with a solution of polyvinylpyrrolidone in water. The granulate is then mixed with sodium starch glycolate and magnesium stearate and compressed to yield kernels of 120 or 350 mg respectively. The kernels are lacquered with an aq. solution / suspension of the above mentioned film coat.

Example B

[1383] Capsules containing the following ingredients can be manufactured in a conventional manner:

Ingredients	Per capsule
Compound of formula (I)	25.0 mg
Lactose	150.0 mg
Maize starch	20.0 mg
Talc	5.0 mg

[1384] The components are sieved and mixed and filled into capsules of size 2.

Example C

[1385] Injection solutions can have the following composition:

Compound of formula (I)	3.0 mg
Polyethylene glycol 400	150.0 mg
Acetic acid	q.s. ad pH 5.0
Water for injection solutions	ad 1.0 ml

[1386] The active ingredient is dissolved in a mixture of Polyethylene glycol 400 and water for injection (part). The pH is adjusted to 5.0 by addition of acetic acid. The volume is adjusted to 1.0 ml by addition of the residual amount of water. The solution is filtered, filled into vials using an appropriate overage and sterilized.
