(54) **PROGRAM AND METHOD FOR CONTROLLING PORTABLE INFORMATION TERMINAL**

(57) A first display screen is displayed on a display when display of the first display screen is selected, the first display screen displaying a control icon that allows operation or confirmation of the state of each of one or more target devices. A second display screen representing a floor plan of a building is displayed on the display when display of the second display screen is selected. A device icon representing each of the one or more target devices is displayed as overlapped on the second display

screen representing the floor plan. The floor plan represented on the second display screen includes one or two or more rooms. The one or two or more rooms include information representing the arrangement position of each of the one or more target devices. The device icon representing each of the one or more target devices is displayed at a position corresponding to the information representing the arrangement position of each of the one or more target devices included in the floor plan.

FIG. 5

EP 2 793 482 A1

## Description

### Technical Field

**[0001]** The present disclosure relates to a control method for an information apparatus and a program.

### Background Art

**[0002]** Technologies for remotely monitoring or remotely controlling one or more target devices using one remote controller are proposed.

**[0003]** Patent Document 1 discloses a technology for remotely operating one or more target devices from a monitor of a television set. Specifically, icons for the one or more target devices are displayed on the right side of a monitor screen. When a desired one of the icons is selected (i), a floor plan is displayed on the left side of the monitor screen (ii). When a pointer is moved to the location of installation of a target device desired to be operated in the floor plan (iii), an operation screen for the target device selected by moving the pointer is displayed on the monitor screen (iv) (paragraphs [0138] to [0140] and Figs. 25A and 25B).

**[0004]** Patent Document 2 discloses a technology for controlling one or more target devices using a single remote controller. Specifically, a floor plan of each room and the condition within the room are displayed on a liquid crystal monitor of the remote controller. For example, the liquid crystal monitor displays a illumination mark displayed in the case where an illumination device of a certain room is turned on, a room temperature mark that indicates the current temperature of a certain room, a lock mark in the shape of a hatched window displayed in the case where a window of a certain room is locked, a device/facility mark that indicates the status or the like of a control target object, a mark that indicates the amount of hot water in the case where the control target is a bath, and so forth (paragraphs [0037] to [0041] and Fig. 6).

**[0005]** Patent Document 3 relates to a technology for remotely controlling and remotely monitoring open/close operation and the state of an electric building material (such as a hallway door or a skylight). Specifically, a monitor screen of a personal computer displays floor plans for first and second floors of a property, a picture of the electric building material (such as a hallway door or a skylight) and a state display icon that indicates the open/close state of the electric building material are displayed at the corresponding position on the floor plans. When the state display icon is selected, an operation screen for the selected electric building material is displayed in another window. The operation screen includes an open operation button, a close operation button, an operation monitor screen, and a button for hiding the operation screen (paragraph [0025] and Figs. 4, 5, and 6).

**[0006]** Patent Document 4 discloses a user interface including a floor plan and an icon. Examples of the icon include an icon representing a receptacle, an icon rep-

resenting a digital image frame, and an icon representing an illumination device (Figs. 7 and 8B).

**[0007]** Patent Document 5 discloses a user interface of an illumination system. When an icon associated with a certain light source is dragged into a target region on a screen and moved toward the center of the target region, the intensity of light from the corresponding light source is increased.

**[0008]** However, Patent Documents 1 to 5 described above need a further improvement.

### Summary of the Invention

**[0010]** In order to address the foregoing issue, an aspect of an aspect of the present invention provides a control method for an information apparatus having a display and being connected to a network, one or more target devices being controlled over the network, the control method causing a computer of the information apparatus to: display a first display screen on the display when display of the first display screen is selected, the first display screen displaying one or more control icons that allow operation or state confirmation of the one or more target devices; display a second display screen representing a floor plan of a building on the display when display of the second display screen is selected, and display one or more device icons respectively representing the one or more target devices on the second display screen representing the floor plan, the floor plan represented on the second display screen including one or more rooms, the one or more rooms including information representing an arrangement position at which each of the one or more target devices is arranged, and the one or more device icons respectively representing the one or more target devices being displayed at a position corresponding to the information representing the arrangement position of each of the one or more target devices included in the floor plan; when the second display screen is selected, and when selection of a device icon representing one target device included in the floor plan is sensed in a region corresponding to a room including information representing the arrangement position of the one target device, display a first control screen on the display as overlapped on the second display screen representing the floor plan, the first control screen allowing at least operation or the state confirmation of the target device corresponding to the sensed device icon; and output a control

command to the network on the basis of an operation on the first control screen, the control command allowing operation or the state confirmation of the target device corresponding to the one target device.

[0011] According to the aspect described above, it is possible to embody a further improvement.

Fig. 71 is a diagram showing the configuration of a device list managed by the home controller for a case where the floor plan shown in Fig. 52 is adopted.

## Description of Embodiments

(Story before Inventing Aspect according to Present Disclosure)

**[0013]** First, the point of view of an aspect according to the present disclosure will be described.

**[0014]** In Patent Document 1 described above, icons for one or more target devices are displayed on the right side of a monitor screen, and a floor plan is displayed on the left side of the monitor screen. That is, the icons for the one or more target devices and the floor plan are displayed separately from each other, and the icons for the one or more target devices are not movable. Therefore, the location of installation of a target device desired to be operated in the floor plan is designated by moving a pointer. Then, an operation screen is displayed.

**[0015]** In Patent Document 1 described above, because of the configuration described above, the number of operation steps to be taken to display an operation screen for a desired target device is large, from (i) to (iv) described above. Therefore, when one or more target devices are remotely monitored or remotely controlled using one remote controller, the operation steps (i) to (iv) described above are required to operate each target device, which complicates operation. This requires a larger number of process steps to be taken by a portable information terminal before a desired target device among the one or more target devices is operated simply because remote controllers for the one or more target devices are integrated into one, which requires a larger number of process operations to be performed by a user.

**[0016]** Patent Document 2 described above describes only displaying the state of each target device, and does not describe at all remotely controlling operation of each target device. Therefore, although the one or more target devices can be remotely monitored using one remote controller, the one or more target devices cannot be controlled.

**[0017]** In Patent Document 3 described above, open/close operation and the state of an electric building material (such as a hallway door or a skylight) are remotely controlled and remotely monitored using a personal computer. However, the content of the remote control is just simple control of open/close operation. In addition, as shown in Fig. 4B, an icon (21b) is hidden by an operation screen (25). As the number of icons displayed on a floor plan (19b) is increased, the number of icons hidden by the operation screen (25) is increased. In this case, in order to search for the next icon that is different from the icon corresponding to the current operation target, there are needed an instruction and a process for temporarily erasing the operation screen (25). In particular, assuming that one or more operation targets are remotely operated using a common remote controller, integration into one remote controller rather increases the number of operations to be performed before a desired operation target is operated, which increases the

time before the desired operation target is operated.

**[0018]** Patent Document 4 described above merely describes an example in which one illumination device and one digital image frame are simply used on one floor (Fig. 8B).

**[0019]** However, although two or more illumination devices are occasionally used on one floor in the real life, Patent Document 4 does not describe a case with a plurality of illumination devices. Therefore, it is difficult to specify at what location on the same floor the illumination device is situated, and the relationship between the illumination device and the location is unclear. In this respect, in Patent Document 4 described above, when an operation screen is opened, the operation screen indicates in which room is the illumination device is situated (Fig. 8B). Consequently, in Patent Document 4, it is unknown in which room the illumination device is situated before the operation screen is opened. Therefore, an illumination device in a room that is different from the illumination device in the desired room may be erroneously operated.

**[0020]** Further, when a network device is selected in the lower left field in Fig. 7 of Patent Document 4 described above, a description of the selected network device appears in the lower right field, and the description includes in which room the network device is installed. However, an operation in the lower section is required separately from that for the floor plan in the upper section, and therefore it is necessary to perform an operation in the lower section and then an operation in the upper section in order to discriminate the relationship between the illumination device and the location. This increases the number of process steps to be taken within the device, the number of operations to be performed by the user, and the number of preparations to be made before a desired operation is reached, which complicates the operation.

**[0021]** Patent Document 5 described above only considers controlling an illumination device for each room such as a bedroom, and does not consider controlling illumination devices for each floor. For example, an illumination device in a room corresponding to a first target region may be turned on by moving an icon from the outside of the first target region to the inside of the first target region. However, when an icon is moved from the first target region to a second target region that is adjacent to the first target region, the icon is moved into the second target region. Therefore, although an illumination device in a room corresponding to the second target region is turned on, an illumination device in a room corresponding to the first target region is turned off since the icon is moved out of the first target region.

**[0022]** Consequently, Patent Document 5 described above does not consider a case where there are two or more target regions on one floor. Therefore, it is unknown at what location on the same floor the illumination device is situated, and the relationship between the illumination device and the location is unclear. In addition, Patent

Document 5 does not consider a case where two or more illumination devices are situated in the same target region, either. As a result, assuming that one or more operation targets are remotely operated using a common remote controller, integration into one remote controller rather incurs an erroneous operation when operating a desired operation target, which complicates the operation.

**[0023]** Based on the considerations described above, the inventors have conceived various aspects of the present invention to be described below.

**[0024]** A control method according to an aspect of the present invention is a control method for an information apparatus having a display and being connected to a network, one or more target devices being controlled over the network, the control method causing a computer of the information apparatus to:

20 display a first display screen on the display when display of the first display screen is selected, the first display screen displaying one or more control icons that allow operation or state confirmation of the one or more target devices;

25 display a second display screen representing a floor plan of a building on the display when display of the second display screen is selected, and display one or more device icons respectively representing the one or more target devices on the second display screen representing the floor plan, the floor plan represented on the second display screen including one or more rooms, the one or more rooms including information representing an arrangement position at which each of the one or more target devices is arranged, and the one or more device icons respectively representing the one or more target devices being displayed at a position corresponding to the information representing the arrangement position of each of the one or more target devices included in the floor plan;

40 when the second display screen is selected, and when selection of a device icon representing one target device included in the floor plan is sensed in a region corresponding to a room including information representing the arrangement position of the one target device, display a first control screen on the display as overlapped on the second display screen representing the floor plan, the first control screen allowing at least operation or the state confirmation of the target device corresponding to the sensed device icon; and

50 output a control command to the network on the basis of an operation on the first control screen, the control command allowing operation or the state confirmation of the target device corresponding to the one target device.

**[0025]** In this case, both the first display screen which

displays the control icon that allows operation or confirmation of the state of each of the one or more target devices and the second display screen which represents the floor plan of the building and which displays the device icon representing each of the one or more target devices are selectably provided.

**[0026]** For example, in the case where the first display screen is selected, and in the case where the user attempts to operate the television set located in front of the user, the first display screen includes only one control icon for the television set if there is only one television set in the building. This allows the user to directly select the control icon for the television set without an erroneous operation, and to display the first control screen corresponding to the television set without an erroneous operation.

**[0027]** On the other hand, although it is possible to operate or confirm the state of the individual target devices in the case where the first display screen is selected for display, the first display screen focuses on the individual target devices, and thus the relationship between the target device and the location at which the target device is disposed is unclear. Therefore, for a plurality of target devices of the same type installed in the same building, such as the air conditioners or the illumination devices, for example, it is unclear the air conditioner or the illumination device in which room is the control target, which may incur an erroneous operation.

**[0028]** According to the present configuration, the second display screen is provided in addition to the first display screen to allow the user to select a desired one of the first display screen and the second display screen.

**[0029]** Consequently, in the case where the second display screen is selected, the relationship between the target device and the location at which the target device is disposed is made definite. Therefore, also for a plurality of target devices of the same type installed in the same building, such as the air conditioners or illumination devices, for example, a discrimination as to the air conditioner or the illumination device in which room is the control target is facilitated. This prevents the user from erroneously operating the air conditioner or the illumination device installed in a room that is different from the desired room.

**[0030]** In addition, the floor plan represented on the second display screen includes information representing the arrangement position of the one or more target devices, and the device icon representing each of the one or more target devices is displayed at a position corresponding to the information representing the arrangement position of each of the target devices. In the case where the second display screen is selected, and when selection of a device icon representing one target device included in the floor plan is sensed in a region corresponding to a room including information representing the arrangement position of the target device, the first control screen is displayed on the display, the first control screen allowing operation or confirmation of the state of

the one target device.

**[0031]** That is, the device icon representing each of the one or more target devices is displayed at a position corresponding to the information representing the arrangement position of each of the one or more target devices included in the floor plan. Therefore, the process step of displaying the floor plan separately from display of the device icon as in Patent Document 1 described above is no longer necessary. In addition, when selection of a device icon representing one target device included in the floor plan is sensed in a region corresponding to a room including information representing the arrangement position of the one target device, a corresponding operation screen is displayed. Thus, the process of moving a pointer to the installation position of the target device desired to be operated and displayed in the floor plan as in Patent Document 1 described above is no longer necessary.

**[0032]** Further, the device icon representing each of the one or more target devices is displayed at a position corresponding to the information representing the arrangement position of each of the one or more target devices included in the floor plan. This allows the user to recognize which device icon corresponds to which target device in which room without inputting other operations before the first control screen is displayed as overlapped on the second display screen. This prevents the user from erroneously operating the target device in a room that is different from the desired target device in the desired room. Further, even in the case where two or more target devices of the same type as that of the desired target device are provided in the desired room, the user can be prevented from erroneously operating the target device that is different from the desired target device in the desired room.

**[0033]** As described above, the user can display the first control screen for the desired target device in the desired room by only selecting the device icon representing one target device included in the floor plan in a region corresponding to a room including information representing the arrangement position of the one target device. This reduces the number of process steps to be performed within the information apparatus and the number of operations to be performed by the user before the first control screen is displayed. Hence, it is possible to prevent a situation where the user displays the first control screen for a target device that is different from the desired target device through an erroneous operation. As a result, it is possible to reduce the number of processes to be performed within the information apparatus or the number of operations to be performed by the user when remote controllers for one or more target devices are integrated into one information apparatus. This reduces the time before the desired target device is operated, and prevents the user from erroneously displaying the first control screen for a different target device through an erroneous operation.

**[0034]** In the aspect described above, for example,

when the first display screen is selected, and when selection of the control icon is sensed, a second control screen is displayed on the display, the second control screen allowing operation or the state confirmation of the target device corresponding to the sensed control icon; and

a control command is output to the network based on an operation on the second control screen, the control command allowing at least operation or the state confirmation of the target device corresponding to the sensed control icon.

**[0035]** In this case, even in the case where the first display screen is selected, as in the case where the second display screen is selected, the user can select the control icon, display the second control screen for a desired device, and operate or confirm the state of the device. The second control screen may be a control screen that is the same as or different from the first control screen displayed as overlapped on the second display screen.

**[0036]** In the aspect described above, for example, when the first control screen is displayed as overlapped on the second display screen representing the floor plan, the device icons representing the one or more target devices may be moved out of a display region of the first control screen.

**[0037]** In this case, when the first control screen is displayed as overlapped on the second display screen representing the floor plan, all the device icons are moved out of the display region of the first control screen. This prevents any of the device icons from being hidden under the first control screen and not displayed. Therefore, it is not necessary for the user to input an extra instruction for erasing the first control screen in order to search for a device icon that is different from the selected device icon. That is, it is no longer necessary for the user to input an instruction for erasing the first control screen in order to redisplay a device icon representing a different target device after an operation on the target device corresponding to the selected device icon is finished. As a result, it is possible to reduce the number of process steps and the number of user operations to be performed since an operation of a certain target device is finished until an operation on another target device is performed.

**[0038]** In addition, selection of the next desired device icon is allowed with the first control screen displayed. Therefore, it is possible to reduce the time since the device icon for the next target device is selected until the target device is operated. As a result, it is possible to reduce the time interval from an operation on one target device to an operation on the next target device in remotely operating a plurality of target devices successively using the information apparatus.

**[0039]** In the aspect described above, for example, when the first control screen is displayed as overlapped on the second display screen representing the floor plan, the device icons representing the one or more target devices may be moved out of a display region of the second control screen.

**[0040]** In this case, when the first control screen is displayed as overlapped on the second display screen representing the floor plan, the device icons representing the one or more target devices are moved out of the display region of the second control screen. This prevents the device icons from being hidden under the first control screen and not displayed. Therefore, it is not necessary for the user to input an extra instruction for erasing the first control screen in order to search for a device icon that is different from the selected device icon. That is, it is no longer necessary for the user to input an instruction for erasing the first control screen in order to redisplay a device icon representing a different target device after an operation on the target device corresponding to the selected device icon is finished. As a result, it is possible to reduce the number of process steps and the number of user operations to be performed since an operation of a certain target device is finished until an operation on another target device is performed.

**[0041]** In addition, selection of the next desired device icon is allowed with the first control screen displayed. Therefore, it is possible to reduce the time before an operation on the next target device. As a result, it is possible to reduce the interval from an operation on one target device to an operation on the next target device in remotely operating a plurality of target devices successively using the information apparatus.

**[0042]** In the aspect described above, for example, when the device icons representing the one or more target devices are moved out of the display region of the second control screen representing the floor plan, the device icons representing the one or more target devices may be arranged in accordance with the one or more rooms that correspond to the one or more target devices and that are included in the floor plan represented by the second display screen.

**[0043]** In this case, display control in which the device icons are arranged in accordance with the rooms is performed in the case where a large number of device icons are provided, for example. This makes it easy for the user to select a device icon corresponding to the next target device in controlling or confirming the state of the next target device in the same room.

**[0044]** Thus, it is possible to reduce the operation interval from an operation on one target device to an operation on the next target device in remotely operating a plurality of target devices successively using the information apparatus even in the case of controlling or confirming the state of a large number of target devices, for example.

**[0045]** In the aspect described above, for example, when the device icons representing the one or more target devices are moved out of the display region of the second control screen representing the floor plan, the device icons representing the one or more target devices may be arranged in accordance with model types of the one or more target devices.

**[0046]** In this case, display control in which the device

icons are arranged in accordance with the model types is performed in the case where a large number of device icons are provided, for example. This makes it easy for the user to select a device icon corresponding to the next target device in successively controlling or confirming the state of the target devices of the same type.

**[0047]** In the aspect described above, for example, the information representing the arrangement positions of the one or more target devices comprises images representing the one or more target devices.

**[0048]** In this case, it is possible to specify the arrangement position of the target device by recognizing the image of the target device represented on the floor plan using an image recognition technology, for example. As a result, the information apparatus can dispose the device icon at an appropriate position on the floor plan without causing the user to input the display position of the device icon on the floor plan.

**[0049]** In the aspect described above, for example, the information representing the arrangement positions of the one or more target devices comprises text information representing the one or more target devices.

**[0050]** In this case, it is possible for the information apparatus to specify the arrangement position of the target device by recognizing the text information for the target device represented on the floor plan using a character recognition technology, for example. As a result, the information apparatus can dispose the device icon at an appropriate position on the floor plan without causing the user to input the display position of the device icon on the floor plan.

**[0051]** In the configuration described above, the floor plan may be a plan view that planarly shows an arrangement and a shape of rooms included in each of the one or more floors of the building.

**[0052]** In this case, the target device can be operated while specifically recognizing the floor plan for each floor, which allows operation with presence.

**[0053]** In the configuration described above, the floor plan may be a diagram in which blocks representing the one or more rooms in the building are arranged in a matrix for each floor of the building.

**[0054]** In this case, a diagram in which blocks representing the rooms are arranged for each floor is used as the floor plan. Therefore, the rooms forming each floor are represented orderly, which allows the user to immediately recognize what rooms form each floor.

**[0055]** In the configuration described above, the information apparatus may include a device list in which coordinates on the floor plan corresponding to actual arrangement positions of the one or more target devices are registered in advance, and the one or more device icons are arranged at positions indicated by the coordinates in the device list.

**[0056]** In this case, the device icons can be disposed accurately at positions on the floor plan corresponding to the actual arrangement positions of the target devices.

**[0057]** In the configuration described above, the infor-

mation apparatus may include a device list, information regarding rooms in which the one or more devices are arranged being registered in the device list, and the one or more device icons are arranged within the blocks representing the corresponding rooms, in accordance with the information regarding the rooms registered in the device list.

**[0058]** In this case, the device icons can be disposed accurately within the blocks representing the rooms in which the corresponding target devices are actually disposed.

(Embodiment)

**[0059]** An embodiment of the present disclosure will be described below with reference to the drawings. In the drawings, the same symbols are used for the same constituent elements.

**[0060]** In the embodiment, a home controller which can singly control one or more devices will be described.

(Overall Configuration)

**[0061]** Fig. 1 is a diagram showing an overall configuration of a home control system to which a home controller according to the embodiment is applied. As shown in Fig. 1, the home control system includes a home controller 100, a device 200 (an example of a target device), and a server 300.

**[0062]** The home controller 100 and one or more devices 200 (for example, a device A 200 and a device B 200) are disposed in a house. The server 300 is disposed in a cloud center. The home controller 100, the device 200, and the server 300 communicate with each other via a wired or wireless network. For example, the device 200 and the home controller 100 are communicably connected to each other via a wireless or wired in-home network, and the home controller 100, the device 200, and the server 300 are communicably connected to each other via an external network such as the Internet.

**[0063]** The home controller 100 is not necessarily disposed in the house, and may be disposed outside the house. In this case, a user controls the one or more devices 200 from a location away from the home.

**[0064]** A portable information terminal such as a smartphone or a tablet terminal may be adopted as the home controller 100. It should be noted, however, that the smartphone and the tablet terminal are merely exemplary, and a portable information terminal of a button type such as a cellular phone may be adopted as the home controller 100.

**[0065]** Fig. 2 is a diagram showing the main devices 200 to be controlled by the home controller 100. The home controller 100 controls the devices 200 such as an air conditioner 201, illumination devices 202 and 203, a bath 204, a refrigerator 205, a washing machine 206, a toilet 207, and a curtain 208. The devices 200 to be controlled by the home controller 100 may include a plurality

of devices 200 of the same type such as the illumination devices 202 and 203.

**[0066]** The devices 200 such as the air conditioner 201 shown in Fig. 2 are merely exemplary, and a television set, a Blu-ray recorder, an audio device, and so forth may be adopted as the devices 200. That is, any electrical device that functions to communicate with the home controller 100 may be adopted as the device 200. In Fig. 2, electrical devices for use in ordinary households are shown as the devices 200. However, the embodiment is not limited thereto, and office devices for use in offices or the like may be adopted as the devices 200. Examples of the office devices include a printer, a personal computer, a scanner, and a copy machine.

**[0067]** Fig. 3 is a block diagram showing the configuration of the home controller 100, the device 200, and the server 300. As shown in Fig. 3, the home controller 100 includes a display 101, a touch panel control section 102, a display control section 103, a storage section 104, a device management section 105, a device control section 106, and a communication control section 107.

**[0068]** The display 101 is formed from a touch panel display, for example, and displays a user interface that allows the user to operate the home controller 100. The user can input various operations to the home controller 100 by contacting the display 101.

**[0069]** The touch panel control section 102 recognizes an operation performed on the display 101 by the user, interprets the content of the operation, and notifies the other constituent elements of the content of the operation. For example, if an object is displayed at a position on the display 101 tapped on by the user, the touch panel control section 102 determines that the object is selected by the user. A variety of GUI parts that receive a user operation such as buttons are adopted as the object.

**[0070]** The display control section 103 generates a GUI (Graphical User Interface) of the home controller 100, and causes the display 101 to display the GUI. The storage section 104 stores information that is necessary for operation of the home controller 100 such as a device list managed by the device management section 105.

**[0071]** The device management section 105 manages the control target devices 200 using the device list stored in the storage section 104. In addition, the device management section 105 detects a device 200 when the device 200 is connected to the in-home network. Further, the device management section 105 acquires home information 2700 to be discussed later from the server 300, stores the acquired home information 2700 in the storage section 104, and manages the home information 2700. The device control section 106 issues a control command for the devices 200. The communication control section 107 controls communication between the home controller 100 and the devices 200 and communication between the home controller 100 and the server 300. In addition, the communication control section 107 transmits a variety of data to the devices 200 or the server 300 upon receiving a request to transmit such data from other

blocks, and receives data transmitted from the devices 200 or the server 300 to deliver the data to the relevant block.

**[0072]** The display 101 may be a normal display rather than a touch panel display. In this case, the user may use an external input device such as a mouse (not shown) to input an instruction to select an object by moving a pointer displayed on the display 101 and clicking on a desired object. That is, in the embodiment, a series of operations performed by the user by contacting the display 101 may be replaced with operations of moving a pointer and clicking using an external input device such as a mouse.

**[0073]** As shown in Fig. 3, the device 200 includes a control execution section 201, a state management section 202, a storage section 204, and a communication control section 207. The control execution section 201 receives a control command from the home controller 100 or the server 300, and controls the device 200 in accordance with the received control command. The content of control of the device 200 performed by the control execution section 201 differs in accordance with the type of the device 200. For example, if the device 200 is an illumination device, the control execution section 201 turns on and off the illumination device. In addition, the control execution section 201 transmits the result of execution of the control command and the state of the device 200 to the home controller 100 or the server 300.

**[0074]** The state management section 202 manages the state of the device 200. The content of management of the device 200 performed by the state management section 202 differs in accordance with the type of the device 200. For example, if the device 200 is an illumination device, the state management section 202 manages whether the illumination device is currently turned on or turned off. The storage section 204 stores information related to the state of the device 200 managed by the state management section 202. The communication control section 207 controls communication between the device 200 and the home controller 100 and communication between the device 200 and the server 300. In addition, the communication control section 207 transmits a variety of data to the home controller 100 or the server 300 upon receiving a request to transmit such data from other blocks, and receives data transmitted from the home controller 100 or the server 300 to deliver the data to the relevant block.

**[0075]** As shown in Fig. 3, the server 300 includes a home information management section 301, a device control section 302, a storage section 304, and a communication control section 307. The home information management section 301 manages the home information 2700 to be discussed later for each house or each user account. In addition, the home information management section 301 transmits the home information 2700 to the home controller 100 in response to a request from the home controller 100. Further, the home information management section 301 acquires log information relat-

ed to the use history of the device 200 and information related to the state of the device 200 from the device 200, stores the acquired information in the storage section 304, and manages the information.

**[0076]** The device control section 302 transmits a control command to the device 200 in response to a request from the home controller 100. The storage section 304 stores information that is necessary for operation of the server 300 such as the home information 2700 and the information related to the state of the device 200 managed by the home information management section 301. The communication control section 307 controls communication between the server 300 and the home controller 100 and communication between the server 300 and the device 200 as with the communication control section 107. In addition, the communication control section 307 transmits a variety of data to the home controller 100 or the device 200 upon receiving a request to transmit such data from other blocks, and receives data transmitted from the home controller 100 or the device 200 to deliver the data to the relevant block.

**[0077]** Fig. 4 is a diagram showing a configuration example of the form of implementation of the home controller 100. As shown in Fig. 4, the home controller 100 includes an application 401, an OS (Operating System) 402, a memory 403, and other hardware (not shown).

**[0078]** The application 401 is application software for causing the portable information terminal to function as the home controller 100, and is executed by a processor of the home controller 100. The home controller 100 may read the application 401 from a computer readable recording medium to implement the application 401, or may download the application 401 from a network to implement the application 401. The OS 402 is basic software of the portable information terminal, and is executed by the processor of the home controller 100. The memory 403 is formed from a storage device such as a RAM and a ROM of the home controller 100, and stores a group of data included in the application 401. The processor of the home controller 100 executes the application 401 to embody the functions of the touch panel control section 102, the display control section 103, the storage section 104, the device management section 105, the device control section 106, and the communication control section 107 shown in Fig. 3. In addition, the processor of the home controller 100 executes the application 401 to cause the memory 403 to function as the storage section 104.

**[0079]** It should be noted, however, that in the embodiment, the home controller 100 may be implemented by the application 401 alone, may be implemented by the application 401 and the OS 402, may be implemented by the application 401, the OS 402, and the memory 403, or may be implemented by the application 401, the OS 402, the memory 403, and other hardware (not shown). In any embodiment, the home controller 100 according to the embodiment can be embodied. In the embodiment, the processor and the storage device forming the port-

able information terminal, for example, form a computer. One of a CPU, an FPGA, and an ASIC or a combination of two or more of these may be adopted as the processor. One of a ROM, a RAM, and a hard disk or a combination of two or more of these may be adopted as the storage device.

**[0080]** Fig. 5 is a diagram showing the configuration of a basic screen of the home controller 100. As shown in Fig. 5, the basic screen of the home controller 100 displayed on the display 101 include a floor plan 500, device icons 501, and a device list display change button 503. The floor plan 500 is a plan view that planarily represents the arrangement and the shape of one or more rooms forming each floor of a house. In the case where the house has one or more floors, the floor plan 500 is prepared for each floor. For example, in the case where the house has two floors, two floor plans 500, namely a floor plan 601 for the first floor and a floor plan 602 for the second floor, are displayed on the display 101 as shown in Fig. 6.

**[0081]** The device icon 501 is an icon displayed as overlapped on the floor plan 500 and representing the device 200. When the touch panel control section 102 senses a tap on the device icon 501 performed by the user, the display control section 103 causes the display 101 to display a device control screen 502 to be discussed later. This allows the user to control the device 200 by operating the device control screen 502.

**[0082]** The device icon 501 is prepared for each device 200. The display control section 103 disposes the device icon 501 on the floor plan 500 on the basis of the actual arrangement of the device 200 within the house. Information as to at what position on the floor plan 500 the device icon 501 is to be disposed is registered in an arrangement 3104 of a device list 3100 to be discussed later. Here, a position on the floor plan 500 corresponding to the actual arrangement position of the device 200 is registered in the arrangement 3104. Thus, the display control section 103 can dispose the device icon 501 at a position on the floor plan 500 corresponding to the actual arrangement position of the device 200 by disposing the device icon 501 at the position registered in the arrangement 3104 of the device list 3100.

**[0083]** In the floor plan 500 shown in Fig. 5, one floor is partitioned into a plurality of rooms by partition lines that indicate partitions between the rooms. This allows the user to recognize what device 200 is disposed in what room at a glance.

**[0084]** In the example of Fig. 5, in addition, schematic images of furniture pieces are displayed at positions on the floor plan 500 corresponding to the actual arrangement positions of the furniture pieces. An image that indicates the movable range of a door is displayed at a position on the floor plan 500 corresponding to the actual arrangement position of the door. An image of a staircase is displayed at a position on the floor plan 500 corresponding to the actual arrangement position of the staircase. This allows the user to recognize the positions of

the furniture pieces disposed in each room and the positions of the staircase and the doors on the floor.

**[0085]** The button with a text "TO LIST UI" displayed at the lower right of the basic screen is the device list display change button 503, which is a button for switching the screen display from the basic screen to a device list display screen to be discussed later (see Fig. 24). When the touch panel control section 102 senses a tap on the device list display change button 503 performed by the user, the display control section 103 switches the screen display on the display 101 from the basic screen to the device list display screen. It should be noted, however, that the display control section 103 may hide the device list display change button 503 in the case where a registration is made in the home controller 100 in advance that the device list display screen is not utilized.

**[0086]** In the foregoing description, one device icon 501 is correlated with one device 200. However, the embodiment is not limited thereto, and one device icon 501 may be correlated with a plurality of devices 200 so that the one device icon 501 may be used in common to the plurality of devices 200. For example, in the case where there are two illumination devices in a living room, the two illumination devices may be represented by one device icon 501.

**[0087]** In this case, when the device icon 501 representing the two illumination devices is tapped on by the user, the display control section 103 causes the display 101 to display a device control screen 502 that allows simultaneous control of the two illumination devices. This allows the user to control the two illumination devices at the same time. A plurality of illumination devices are often disposed in a large room such as the living room. In the case where the user turns on or off the illumination devices in the living room, the user often turns on or off all the illumination devices disposed in the living room, rather than turning on or off some of the illumination devices. In this case, if it is possible to collectively turn on or off all the illumination devices, the number of operations to be performed by the user can be reduced. Thus, one device icon 501 may be correlated with a plurality of devices 200 that are highly likely to be operated by the user at the same time to cause one device control screen 502 to be displayed.

**[0088]** In the case where the device icon 501 represents a plurality of devices 200, the display control section 103 may display the device icon 501 at a position on the floor plan 500 corresponding to the actual arrangement position of one of the devices 200. Alternatively, the display control section 103 may display the device icon 501 representing the plurality of devices 200 at a predetermined location of a room in which the plurality of devices 200 are disposed.

**[0089]** In order to dispose the device icon 501 on the floor plan 500 on the basis of the actual arrangement of the device 200 within the house, the user moves the device icon 501 to an appropriate position on the floor plan 500. The user can move the device icon 501 to a desired

position by dragging the device icon 501 while holding down the device icon 501. These operations are executed at the timing when the device icon 501 is added such as when the home controller 100 is initially utilized and when a new device 200 is purchased.

**[0090]** Specifically, when the touch panel control section 102 senses a drag on the device icon 501, the device management section 105 registers the position on the floor plan 500 of the device icon 501 after the movement in the arrangement 3104 of the device list 3100 to be discussed later. This allows a position on the floor plan 500 corresponding to the actual arrangement position of the device 200 to be registered in the arrangement 3104.

**[0091]** The initial display position of the device icon 501 may be determined in advance by the system, and may be a predetermined position outside the display region of the floor plan 500 or a predetermined position within a predetermined room on the floor plan 500, for example. The method of disposing the device icon 501 on the floor plan 500 on the basis of the actual arrangement of the device 200 within the house is not limited thereto, and the method described below may be used.

**[0092]** As shown in Figs. 7, 8, and 9, some floor plans 500 include arrangement information for the device icons 501. For example, in the example of the floor plan 500 of Fig. 7, texts that indicate the type of the devices 200 represented by the device icons 501 to be disposed are provided at positions at which the device icons 501 are to be disposed. In the example of the floor plan 500 of Fig. 8, images that indicate the type of the devices 200 represented by the device icons 501 to be disposed are provided at positions at which the device icons 501 are to be disposed. In the example of the floor plan 500 of Fig. 9, simplified images such as circles and rectangles that indicate the type of the devices 200 represented by the device icons 501 to be disposed are provided at positions at which the device icons 501 are to be disposed.

**[0093]** Consequently, in the case where the floor plan 500 includes arrangement information for the device icons 501, the display control section 103 may generate the basic screen of Fig. 5 by automatically disposing the device icons 501 on the floor plan 500 on the basis of the arrangement information included in the floor plan 500. In this case, it is not necessary for the user to perform an operation of moving the device icons 501 to appropriate positions on the floor plan 500.

**[0094]** For example, in an exemplary floor plan 4401 for the first floor of Fig. 7, the display control section 103 detects a position provided with a text "TELEVISION SET", automatically disposes the device icon 501 for the television set at the detected position, and registers the detected position in the arrangement 3104 of the device list 3100.

**[0095]** In an exemplary floor plan 4501 for the first floor of Fig. 8, the display control section 103 detects a position provided with an image for the "television set", automatically disposes the device icon 501 for the television set at the detected position, and registers the detected po-

sition in the arrangement 3104 of the device list 3100. In an exemplary floor plan 4601 for the first floor of Fig. 9, the display control section 103 detects a position provided with an image in the shape of a "circle filled with oblique lines", automatically disposes the device icon 501 for the television set at the detected position, and registers the detected position in the arrangement 3104 of the device list 3100.

**[0096]** The display control section 103 may detect the display position of arrangement information by recognizing the arrangement information included in the floor plan 500 using a text recognition technology or an image recognition technology commonly utilized.

**[0097]** Fig. 10 is a diagram illustrating a method of switching the floor display on the basic screen of the home controller 100. Fig. 10 illustrates a case where the house has two floors, namely the first floor and the second floor. With a floor plan 601 for the first floor displayed on the basic screen of the home controller 100, the touch panel control section 102 senses a tap on a staircase region 603 on the first floor performed by the user. Then, the display control section 103 switches the floor display on the basic screen from the first floor to the second floor. Similarly, with a floor plan 602 for the second floor displayed on the basic screen of the home controller 100, the touch panel control section 102 senses a tap on a staircase region 604 on the second floor performed by the user. Then, the display control section 103 switches the floor display on the basic screen from the second floor to the first floor.

**[0098]** Here, the touch panel control section 102 may judge that the staircase region 603 is tapped on if the position tapped on by the user is positioned within a region surrounded by four vertexes of a staircase registered in a room type 2902 of room information 2900 (see Fig. 32).

**[0099]** Further, the floor display may be switched by not only tapping on the staircase region 603 but also a swipe operation on the display 101. With the floor plan 601 for the first floor displayed on the basic screen of the home controller 100, the touch panel control section 102 senses a swipe operation performed from the right to the left on the display 101 by the user. Then, the display control section 103 switches the floor display on the basic screen from the first floor to the second floor. Similarly, with the floor plan 602 for the second floor displayed on the basic screen of the home controller 100, the touch panel control section 102 senses a swipe operation performed from the left to the right on the display 101 by the user. Then, the display control section 103 switches the floor display on the basic screen from the second floor to the first floor. The floor display may be switched by a swipe operation in the vertical direction.

**[0100]** Fig. 11 is a diagram showing the configuration of the display state of the device control screen 502 of the home controller 100. In the basic screen shown in Fig. 5, when the touch panel control section 102 senses that the user selects the device icon 501, the display con-

trol section 103 causes the display 101 to display the device control screen 502 corresponding to the selected device icon 501. The device control screen 502 is a control screen that is specific to each device 200 and that allows control or confirmation of the state of the device 200. For example, in Fig. 11, a device icon 801 for the air conditioner is selected by the user, and the temperature setting and the air flow direction are controlled using the device control screen 502 for the air conditioner.

**[0101]** An image of the air conditioner is displayed in the device control screen 502 to allow the user to immediately recognize that the device control screen 502 corresponds to the air conditioner. This prevents an erroneous operation. An image that indicates the air flow direction is displayed on the lower side of the image of the air conditioner to allow the user to select a desired air flow direction by repeatedly tapping on the image, for example. A numeral displayed within the device control screen 502 indicates the current set temperature of the air conditioner. A button in the shape of a triangle that points upward in the device control screen 502 is a temperature increase button. A button in the shape of a triangle that points downward is a temperature decrease button. Pressing the temperature increase button once increases the set temperature of the air conditioner by a predetermined temperature (for example, 0.5 degrees). Pressing the temperature decrease button once decreases the set temperature of the air conditioner by a predetermined temperature (for example, 0.5 degrees).

**[0102]** Examples of the method of disposing the device icons 501 in the display state of the device control screen 502 include the following methods.

**[0103]** A first method is to dispose the device icons 501 outside the display region of the device control screen 502 as shown in Fig. 11. When the touch panel control section 102 senses that a certain device icon 501 is tapped on by the user, the display control section 103 disposes all the device icons 501 at locations outside the display region of the device control screen 502 and inside the display region of the display 101 irrespective of whether or not the locations are inside the display region of the floor plan 500. In the example of Fig. 11, the device icons 501 are disposed in an elliptical arrangement so as to surround the device control screen 502. That is, when a certain device icon 501 is selected by the user and the device control screen 502 for the device 200 corresponding to the device icon 501 is displayed, the display control section 103 retracts all the device icons 501 out of the display region of the device control screen 502.

**[0104]** This prevents the device icons 501 from being hidden by the device control screen 502. Therefore, in the case where the device control screen 502 for a device 200 is currently displayed and the user attempts to cause the device control screen 502 for another device 200 to be displayed, it is not necessary for the user to temporarily erase the currently displayed device control screen 502 and search for the device icon 501 for the relevant

device 200.

**[0105]** Here, the display control section 103 may decide the arrangement position of each device icon 501 on the outer periphery of an ellipse having a shape determined in advance in accordance with the size of the device control screen 502, and dispose the device icon 501 at the decided position, for example. Examples of the method of deciding the arrangement position include a method of arranging all the device icons 501 as display targets at equal intervals on the outer periphery of an ellipse, and a method of disposing the device icons 501 such that the angles formed by lines connecting between adjacent device icons 501 and the center of an ellipse are equal to each other. Alternatively, the display control section 103 may divide the outer periphery of an ellipse into four sections corresponding to the upper, lower, left, and right portions of the device control screen 502, and dispose the device icons 501 such that the number of device icons 501 in each section is the same and the device icons 501 in each section are arranged at equal intervals. The device icon 501 disposed at the closest position on the floor plan 500 may be disposed at the decided arrangement position.

**[0106]** In the foregoing description, the device icons 501 are arranged in an elliptical arrangement. However, the embodiment is not limited thereto, and the device icons 501 may be arranged in a circular arrangement. Also in this case, the arrangement position of the device icons 501 may be decided using the same method as in the case where the device icons 501 are arranged in an elliptical arrangement. Other examples of the shape of arrangement of the device icons 501 used when the device icons 501 are retracted out of the display region of the device control screen 502 include polygonal arrangements such as triangular, rectangular, and pentagonal arrangements.

**[0107]** A second method is to dispose the device icons 501 in one line outside the display region of the device control screen 502 and the floor plan 500 and inside the display region of the display 101 as shown in Fig. 13. When the touch panel control section 102 senses that a certain device icon 501 is tapped on by the user, the display control section 103 disposes all the device icons 501 in one vertical line on the left side of the display region of the floor plan 500. That is, the display control section 103 retracts all the device icons 501 to a vacant space outside the display region of the floor plan 500 and inside the display region of the display 101.

**[0108]** In Fig. 13, the device icons 501 are disposed on the left side of the floor plan 502. However, the embodiment is not limited thereto, and the device icons 501 may be disposed in one vertical line on the right side of the floor plan 502, or may be disposed in one horizontal line on the upper or lower side of the floor plan 500.

**[0109]** In the case where all the device icons 501 cannot be disposed on the left side of the floor plan 500, the display control section 103 may scroll the device icons 501 upward or downward in accordance with a swipe

operation performed upward or downward on the device icons 501 disposed in one vertical line on the left side to cause the device icons 501, which have been hidden, to be displayed within the display 101.

**[0110]** This allows the device icons 501, which have been hidden, to be displayed within the display 101 to allow the user to select the device icons 501. In the case where the device icons 501 are displayed in one horizontal line and all the device icons 501 may not be displayed, the display control section 103 may scroll the device icons 501 leftward or rightward in accordance with a swipe operation performed leftward or rightward on the device icons 501 disposed in one horizontal line to cause the device icons 501, which have been hidden, to be displayed within the display 101.

**[0111]** In the display state of the device control screen 502, the display control section 103 may display the device icon 501 selected by the user in a display mode that is different from that for the unselected device icons 501. This allows the user to easily recognize the selected device icon 501.

**[0112]** For example, as shown in Fig. 11, the display control section 103 may display the selected device icon 801 in a color that is different from that of the other unselected device icons 501. Specifically, the display control section 103 may display a background portion of the selected device icon 501 in a color that is different from that of background portions of the unselected device icons 501. It should be noted, however, that such a display mode is merely exemplary, and the display control section 103 may make the selected device icon 501 brighter than the unselected device icons 501, may make the selected device icon 501 denser than the unselected device icons 501, or may cause the selected device icon 501 to flash on and off at a constant cycle.

**[0113]** In the display state of the device control screen 502, the device icon 501 selected by the user may be disposed as distinguished from the unselected device icons 501. This allows the user to easily recognize the selected device icon 501.

**[0114]** For example, as shown in Fig. 12, the display control section 103 may dispose a selected device icon 901 at the uppermost position on the outer periphery of an ellipse. Besides, for example, the display control section 103 may dispose the selected device icon 501 at a particular position (for example, the lowermost position, the rightmost position, or the leftmost position) on the outer periphery of an ellipse. In any event, the display control section 103 may dispose the device icon 501 selected by the user at a particular location that is easily recognizable by the user.

**[0115]** Besides, for example, as shown in Fig. 14, the display control section 103 may scroll an array of the device icons 501 such that a selected device icon 1101 is disposed within the display region of the display 101. In the example of Fig. 14, the device icons 501 are scrolled such that the selected device icon 1101 is disposed at the center of a line of icons displayed in one

vertical line on the left side of the floor plan 500. This allows the user to easily recognize the selected device icon 501. Although the device icon 1101 is disposed at the center of the line of icons in Fig. 14, the device icon 1101 may be disposed at any other conspicuous position. For example, the device icon 1101 may be disposed at the top or bottom position of the line of icons.

**[0116]** The order of arrangement of the device icons 501 taken when the device icons 501 are retracted of the display region of the floor plan 500 may be determined such that devices 200 that are closer in position of arrangement on the floor plan 500 to the device icon 501 selected by the user are disposed to be closer in order of arrangement to the selected device icon 501. Alternatively, the order of arrangement of the device icons 501 may be determined such that the device icons 501 for devices 200 that are more likely to be used together with the device 200 selected by the user are disposed to be closer in order of arrangement to the device icon 501 for the device 200 selected by the user. For example, the television set and the Blu-ray recorder are highly likely to be used together by the user. Therefore, when the device icon 501 for the television set is selected by the user, the device icon 501 for the Blu-ray recorder may be displayed next to the device icon 501 for the television set. In order to embody such a configuration, a table that indicates combinations of devices 200 that are highly likely to be used together may be stored in advance in the storage section 104, and the arrangement of the device icons 501 may be decided in accordance with the table.

**[0117]** In any of the methods of disposing the device icons 501 taken when the device control screen 502 is displayed described above, in addition, the display control section 103 may dispose the device icons 501 as grouped under particular conditions.

**[0118]** For example, in Fig. 15, the device icons 501 are grouped in accordance with the location at which the devices 200 are disposed. The devices 200 disposed in the living room are grouped as device icons 1201. The devices 200 disposed in a lavatory are grouped as device icons 1202. The devices 200 disposed in a bedroom are grouped as device icons 1203. Then, the display order is set to each group, and the grouped device icons 501 are disposed in one vertical line on the left side of the floor plan 500 in accordance with the display order. The display order of the groups may be determined such that groups that are positioned closer to the room in which the device 200 selected by the user is disposed are closer in display order to the group for the room in which the device 200 selected by the user is disposed.

**[0119]** Besides, the display control section 103 may dispose the device icons 501 as grouped in accordance with the type of the devices 200. For example, in Fig. 16, two device icons 501 for the television set are disposed on the left side of the floor plan 500 as grouped as device icons 2301, and two device icons 501 for the air conditioner are disposed on the left side of the floor plan 500 as grouped as device icons 2302 for the air conditioner.

Consequently, the display control section 103 may group the device icons 501 in accordance with the device type by disposing the device icons 501 for the devices 200 of the same type to be continuous.

**[0120]** The display control section 103 may discriminate the type of the devices 200 in accordance with the content registered in a device type 3102 of the device list 3100 (see Fig. 35).

**[0121]** Although the device icons 501 for the devices 200 of the same type are grouped into one group in the foregoing description, the embodiment is not limited thereto. For example, the display control section 103 may classify the devices 200 into categories matching the device type, group the device icons 501 in accordance with the category, and dispose the device icons 501 on the left side of the floor plan 500 in groups.

**[0122]** For example, as shown in the lower left of Fig. 16, three device icons 501 for the refrigerator, a microwave oven, and a dish washing/drying machine are classified into a cooking device category, and therefore the three device icons are grouped as device icons 2303 for the cooking devices and disposed on the left side of the floor plan 500.

**[0123]** Examples of the other categories include entertainment devices and air-conditioning devices. The entertainment device category includes devices 200 such as a television set, a recorder, a player, and a home theater system. The air-conditioning device category includes devices 200 such as an air conditioner, an air purifier, a humidifier, a dehumidifier, and a home air circulation system.

**[0124]** For example, if the device icons 501 for the television set, the recorder, the air conditioner, and the air purifier are disposed on the floor plan 500 and the device icon 501 for the television set is selected by the user, the device icons 501 for the television set and the recorder classified into the entertainment device category are grouped into one group and disposed on the left side of the floor plan 500, and the device icons 501 for the air conditioner and the air purifier classified into the air-conditioning device category are grouped into one group and disposed on the left side of the floor plan 500.

**[0125]** The display control section 103 may determine the category of the devices 200 from the content registered in the device type 3102 of the device list 3100. In this case, a classification table for determining the category of the devices 200 from the content registered in the device type 3102 may be stored in advance in the storage section 104, and the display control section 103 may reference the classification table to discriminate the category of the devices 200.

**[0126]** A variety of manners of classifying the devices 200 according to the device type may be adopted besides that described above. For example, as shown in Fig. 24, the devices 200 may be classified into household appliance, air-conditioning, and facility categories.

**[0127]** The method of grouping the device icons 501 on the basis of particular conditions and disposing the

device icons 501 as described above may also be applied to the display mode in which the device icons 501 are retracted so as to surround the device control screen 502 as shown in Fig. 11.

**[0128]** Figs. 17A and 17B are each a diagram showing a method of displaying the floor plan 500 with the device control screen 502 displayed. As shown in Figs. 17A and 17B, there are two types of the method of displaying the floor plan 500. In a first display method, as shown in Fig. 17A, the entire floor plan 500 is covered by a translucent gray layer (in the drawing, indicated by dots).

**[0129]** In this case, the background of the device control screen 502 is turned into a gray color to emphasize the device control screen 502, which allows the user to more definitely recognize the device control screen 502. In addition, the gray layer is translucent, and the floor plan 500 is not completely hidden. This allows the device control screen 502 to be operated with presence. The gray layer is image data having a color with low brightness such as gray and set to predetermined transparency.

**[0130]** The display control section 103 may decide the display order of the device control screen 502, the gray layer, and the floor plan 500 such that the device control screen 502 is the uppermost layer and the floor plan 500 is the lowermost layer, and synthesize these images. This prevents the device control screen 502 from being displayed as covered by the gray layer.

**[0131]** In a second display method, as shown in Fig. 17B, a non-control target region 1302 in the floor plan 500 is covered by a translucent gray layer (the region with dots in the drawing), and a control target region 1301 is not covered by the translucent gray layer. This allows the user to operate the device control screen 502 while being conscious of the control target region 1301, which allows operation with presence. Here, the control target region 1301 refers to a region on the floor plan 500 that corresponds to a room in which the device 200 represented by the device icon 501 selected by the user is disposed, and the non-control target region 1302 refers to a region on the floor plan 500 other than the room. For example, in the case where the control target device is the air conditioner installed in the living room, the control target region 1301 is the region on the floor plan 500 corresponding to the living room, and the non-control target region 1302 is the region on the floor plan 500 other than the living room.

**[0132]** For example, it is assumed that the user selects the device icon 501 for the air conditioner with a device ID 3101 of A shown in Fig. 35. In this case, the display control section 103 specifies the position (X10, Y100, Z1) of the air conditioner from the content registered in the arrangement 3104 of the air conditioner. Next, the display control section 103 references the room information 2900 to decide in which room the specified position (X10, Y100, Z1) is positioned. Here, it is assumed that the position (X10, Y100, Z1) is positioned within a region surrounded by vertexes with vertex IDs of F, G, H, I, L, O, and N.

Then, the display control section 103 determines that the air conditioner is disposed in the living room with a room ID of A. Then, the display control section 103 generates a gray layer with the region of the living room defined as the control target region 1301 and with the region on the floor plan 500 other than the living room defined as the non-control target region 1302.

**[0133]** Next, transition between the display state of the basic screen and the display state of the device control screen 502 will be described using Fig. 18. In the basic screen shown in the left diagram of Fig. 18, the user selects the device icon 501 for the device 200 (here, the air conditioner) that is desired to be controlled, and the touch panel control section 102 senses the selection. Then, as shown in the right diagram of Fig. 18, the display control section 103 displays the device control screen 502 corresponding to the selected device icon 501 as overlapped on the floor plan 500. This results in transition from the display state of the basic screen to the display state of the device control screen 502.

**[0134]** On the other hand, as shown in the right diagram of Fig. 18, in the display state of the device control screen 502, the user taps on the device icon 501 for the air conditioner corresponding to the device control screen 502 or a location outside the display region of the device control screen 502 (for example, the display region of the floor plan 500 outside the display region of the device control screen 502), and the touch panel control section 102 senses the tap. Then, as shown in the left diagram of Fig. 18, the display control section 103 erases the device control screen 502, and returns from the display state of the device control screen 502 to the display state of the basic screen. At this time, the display control section 103 returns the device icon 501 to the original arrangement position on the floor plan 500.

**[0135]** The operation described above is the same for the floor plan 500 for any floor displayed in the basic screen. For example, as shown in the left diagram of Fig. 19, in the case where the basic screen displays the floor plan 602 for the second floor, the user taps on the device icon 501 for the device 200 (here, the air conditioner) that is desired to be controlled, and the touch panel control section 102 senses the tap. Then, as shown in the right diagram of Fig. 19, the display control section 103 displays the device control screen 502 corresponding to the selected device icon 501 as overlapped on the floor plan 602 for the second floor.

**[0136]** On the other hand, as shown in the right diagram of Fig. 19, in the display state of the device control screen 502 for the air conditioner, the user taps on the device icon 501 for the air conditioner corresponding to the device control screen 502 being displayed or a location outside the display region of the device control screen 502 (for example, the display region of the floor plan 500 outside the display region of the device control screen 502), and the touch panel control section 102 senses the tap. Then, as shown in the left diagram of Fig. 19, the display control section 103 erases the device control screen 502,

and returns from the display state of the device control screen 502 to the display state of the basic screen in which the floor plan 602 for the second floor is displayed.

**[0137]** Next, a method of switching from the display state of a certain device control screen 502 to the display state of another device control screen 502 will be described using Fig. 20. As shown in the left diagram of Fig. 20, in the display state of the device control screen 502 for the air conditioner, the user taps on the device icon 501 for the washing machine which is different from the device icon 501 for the air conditioner, and the touch panel control section 102 senses the tap. Then, as shown in the right diagram of Fig. 20, the display control section 103 erases the device control screen 502 which has been displayed, and displays the device control screen 502 corresponding to the device icon 501 for the washing machine as overlapped on the floor plan 500. Switching in the opposite direction is performed in the same manner.

**[0138]** Consequently, when the user successively selects different device icons 501, switching is successively performed between the device control screens 502, which allows the user to successively control different devices 200. That is, in causing another device control screen 502 to be displayed while a certain device control screen 502 is displayed, it is no longer necessary for the user to input an operation of erasing the certain device control screen 502, and switching can be performed between the device control screens 502 with one touch operation.

**[0139]** In the display state of the device control screen 502, in the case where the user taps on the device icon 501 corresponding to the device control screen 502 being displayed, the display control section 103 may only erase the device control screen 502, and may not return to the basic screen. Such screen transition is shown in Fig. 21.

**[0140]** In the left diagram of Fig. 21, the device icon 501 for the air conditioner is selected by the user, and therefore the device control screen 502 for the air conditioner is displayed, and all the device icons 501 are displayed in one vertical line on the left side of the floor plan 500. In this state, the user taps on the device icon 501 for the air conditioner, and the touch panel control section 102 senses the tap. Then, as shown in the right diagram of Fig. 21, the display control section 103 erases only the device control screen 502 for the air conditioner with the device icons 501 kept displayed in one vertical line. In this case, the device icons 501 do not move onto the floor plan 500, and therefore a user's desire to cause only the floor plan 500 to be displayed may be met.

**[0141]** On the other hand, in the hidden state of the device control screen 502, the user selects a desired device icon 501, and the touch panel control section 102 senses the selection. Then, the display control section 103 displays the device control screen 502 corresponding to the selected device icon 501. For example, in the right diagram of Fig. 21, when the user selects the device icon 501 for the air conditioner from the device icons 501

disposed in one vertical line on the left side of the floor plan 500, the device control screen 502 for the air conditioner is displayed as shown in the left diagram of Fig. 21.

**[0142]** Next, transition from the display state of the basic screen to the display state of the device control screen 502 represented through an animation will be described using Fig. 22. As shown in the upper left diagram of Fig. 22, the user selects the device icon 501 for the air conditioner, for example, in the basic screen. Then, the display control section 103 gradually lowers the transparency of the device control screen 502 for the air conditioner in the order of the upper right diagram, the lower right diagram, and the lower left diagram of Fig. 22 to a final transparency of 0. At the same time, the display control section 103 moves all the device icons 501 onto the outer periphery of an ellipse that surrounds the device control screen 502.

**[0143]** Next, transition from the display state of the basic screen to the display state of the device control screen 502 represented through an animation will be described using Fig. 23. As shown in the upper left diagram of Fig. 23, the user selects the device icon 501 for the device 200 which is the air conditioner, for example, in the basic screen. Then, the display control section 103 gradually decreases the transparency of the device control screen 502 for the air conditioner in the order of the upper right diagram, the lower right diagram, and the lower left diagram of Fig. 23 to a final transparency of 0. At the same time, the display control section 103 moves all the device icons to the left side of the floor plan 500.

**[0144]** Consequently, representing the screen transition through an animation can enhance the interest of the user in operating the device control screen 502 through screen rendering shown since the device icon 501 is selected until the device control screen 502 is displayed.

**[0145]** Fig. 24 is a diagram showing the configuration of a device list display screen. The device list display screen is displayed when the user taps on the device list display change button 503 in the basic screen shown in Fig. 5.

**[0146]** As shown in Fig. 24, the device list display screen includes a device list 2000, device details icons 2001, and a basic screen display button 2003.

**[0147]** When the user taps on the device details icon 2001 and the touch panel control section 102 senses the tap, the display control section 103 causes the device control screen 502 to be displayed as overlapped on the device list 2000. This allows the user to cause the device control screen 502 to be displayed and operate the device 200 as in the case where the device icon 501 is tapped on.

**[0148]** The device details icon 2001 is prepared for each device 200. The device details icon 2001 is different from the device icon 501 in representing not only an image representing the device 200 but also the on/off state and the operation state of the device 200. For example, the device details icon 2001 for the refrigerator displayed

in the upper left of Fig. 24 displays not only an image of the refrigerator but also "ON", which indicates that the refrigerator is currently turned on, and "OPERATION/ICE", which indicates that the refrigerator is currently making ice.

**[0149]** In the device list 2000, the device details icons 2001 are displayed as classified on the basis of a classification criterion determined in advance. Examples of the classification criterion determined in advance include the type of the device 200, the room in which the device 200 is disposed, and the status of use of the device 200. In Fig. 24, the type of the device 200 is used as the classification criterion, and the device details icons 2001 are classified into three categories, namely the household appliance, air-conditioning, and facility categories.

**[0150]** In the example of Fig. 24, the refrigerator, an electric toothbrush, the washing machine, and the television set are classified into the household appliance category, the air conditioner and the air purifier are classified into the air-conditioning category, and the toilet, the illumination device, and the bath are classified into the facility category. In this case, a classification table that determines into which of the household appliance, air-conditioning, and facility categories each device 200 is classified on the basis of the content registered in the device type 3102 of the device list 3100 (see Fig. 35) is stored in advance in the storage section 104. Then, the display control section 103 may reference the classification table to classify each device into a category.

**[0151]** Returning to Fig. 24, the button with a text "TO FLOOR PLAN UI" displayed at the lower right of the device list 2000 is the basic screen display button 2003. The basic screen display button 2003 is a button for switching the screen from the device list display screen to the basic screen.

**[0152]** Although switching can be made between the basic screen and the device list display screen in the foregoing description, the device list display screen may be utilized as the basic screen in place of the basic screen shown in Fig. 5. In this case, the basic screen display button 2003 may be omitted.

**[0153]** In the foregoing description, one device details icon 2001 is correlated with one device 200. However, the embodiment is not limited thereto, and one device details icon 2001 may be correlated with a plurality of devices 200 so that the one device details icon 2001 may be used in common to the plurality of devices 200. For example, in the case where there are two illumination devices in a living room, the two illumination devices may be represented by one device details icon 2001.

**[0154]** In this case, when the device details icon 2001 representing the two illumination devices is tapped on by the user, the display control section 103 causes the display 101 to display a device control screen 502 that allows simultaneous control of the two illumination devices. In this case, the same effect as that obtained in the case where one device icon 501 is used in common to a plurality of devices 200 is obtained. In the case where one

device details icon 2001 is used in common to a plurality of illumination devices, the device details icon 2001 may display the on/off state and the operation state of each of two illumination devices.

**[0155]** In the basic screen, the device details icon 2001 may be used in place of the device icon 501. In the device list display screen, the device icon 501 may be used in place of the device details icon 2001. In addition, the device control screen 502 displayed in the case where the device details icon 2001 is selected and the device control screen 502 displayed in the case where the device icon 501 is selected may be the same as or different from each other. For example, the device details icon 2001 contains more information than that of the device icon 501, and therefore the device control screen 502 displayed in the case where the device details icon 2001 is selected may include more buttons and states than those of the device control screen 502 displayed in the case where the device icon 501 is selected.

**[0156]** Fig. 25 is a diagram showing screen transition between the basic screen and the device list display screen. In the basic screen shown in the left diagram of Fig. 25, when the device list display change button 503 is selected by the user, display on the display 101 is switched to the device list display screen shown in the right diagram of Fig. 25. On the other hand, in the device list display screen shown in the right diagram of Fig. 25, when the basic screen display button 2003 is selected by the user, display on the display 101 is switched to the basic screen shown in the left diagram of Fig. 25.

**[0157]** Specifically, when the touch panel control section 102 senses a tap on the basic screen display button 2003, the display control section 103 switches the display screen on the display 101 to the basic screen showing the device list display screen. On the other hand, in the display state of the basic screen, when the touch panel control section 102 senses a tap on the device list display change button 503, the display control section 103 switches the display screen on the display 101 from the basic screen to the device list display screen.

**[0158]** For example, in the case where the device list display screen is selected for display, and in the case where the user attempts to operate the television set located in front of the user, the device list display screen includes only one device details icon 2001 for the television set if there is only one television set in the house. This allows the user to directly select the device details icon 2001 for the television set without an erroneous operation, and to cause the device control screen 502 corresponding to the television set to be displayed.

**[0159]** On the other hand, in the case where the device list display screen is selected, the device list display screen focuses on the individual devices 200, and thus the relationship between the device 200 and the location at which the device 200 is disposed is unclear, although it is possible to operate or confirm the state of the individual devices 200. Therefore, for a plurality of devices 200 installed within the same building, such as the air

conditioners or the illumination devices, for example, it is unclear the air conditioner or the illumination device in which room is the control target, which may incur an erroneous operation.

**[0160]** Thus, in the embodiment, the basic screen is provided in addition to the device list display screen to allow selection from the basic screen and the device list display screen.

**[0161]** Consequently, in the case where the basic screen is selected, the relationship between the device 200 and the location at which the device 200 is disposed is made definite. Therefore, also for a plurality of devices 200 of the same type installed in the same building, such as the air conditioners or illumination devices, for example, a discrimination as to the air conditioner or the illumination device in which room is the control target is facilitated. This prevents the air conditioner or the illumination device installed in a room that is different from the desired room from being erroneously operated.

**[0162]** Fig. 26 is a diagram showing screen transition between the display state of the device list display screen and the display state of the device control screen 502. In the device list display screen shown in the left diagram of Fig. 26, the user selects the device details icon 2001 for the device 200 (here, the air conditioner) that is desired to be controlled, and the touch panel control section 102 senses the selection. Then, as shown in the right diagram of Fig. 26, the display control section 103 displays the device control screen 502 for the air conditioner corresponding to the selected device details icon 2001 as overlapped on the device list display screen. This results in transition from the display state of the device list display screen to the display state of the device control screen 502.

**[0163]** In the example in the right drawing of Fig. 26, the display control section 103 hides the device details icons 2001 for devices other than the air conditioner selected by the user, and only the device details icon 2001 for the air conditioner is displayed at a position that is different from that in the device control screen 502. This allows the user to definitely recognize the device details icon 2001 that the user himself/herself selected.

**[0164]** On the other hand, as shown in the right diagram of Fig. 26, in the display state of the device control screen 502, the user selects the device details icon 2001 for the air conditioner, and the touch panel control section 102 senses the selection. Then, as shown in the left diagram of Fig. 26, the display control section 103 erases the device control screen 502, and returns from the display state of the device control screen 502 to the display state of the device list display screen.

**[0165]** Although only one device details icon 2001 is displayed in the display state of the device control screen 502 shown in the right diagram of Fig. 26, other device details icons 2001 that are not selected by the user may be displayed in the same manner as in Fig. 13. In this case, the plurality of device details icons 2001 may be displayed in one line at an end of the screen as shown

in Fig. 13, or may be displayed so as to surround the device control screen 502 as shown in Fig. 12.

**[0166]** According to the configuration, the user can successively select the device details icons 2001 in the display state of the device control screen 502 to successively display other device control screens 502. Consequently, in causing another device control screen 502 to be displayed while a certain device control screen 502 is displayed, it is no longer necessary for the user to input an operation of erasing the certain device control screen 502, and switching can be performed between the device control screens 502 with one touch operation.

**[0167]** Fig. 27 is a diagram showing screen transition between the display state of the basic screen and the display state of the device control screen 502 performed in the case where the basic screen includes a plurality of device icons 501 representing the devices 200 of the same type. As shown in the left diagram of Fig. 27, the basic screen includes two device icons 501 for the television set. Here, the device icon 501 for a television set A is represented as a device icon 2401, and the device icon 501 for a television set B is represented as a device icon 2402. At this time, the user can intuitively select a television set that is desired to be controlled from the floor plan 500, and operate the television set.

**[0168]** For example, in the right diagram of Fig. 27, the device icon 2401 for the television set A is selected, and a device control screen 2403 for the television set A is displayed. Consequently, even if there are a plurality of device icons 501 for the devices 200 of the same type, each device icon 501 is disposed at a position on the floor plan 500 corresponding to the actual installation position. This allows the user to intuitively select the device icon 501 for a device 200 that is desired to be controlled in accordance with the display position on the floor plan 500, which prevents the device control screen 502 for another device 200 from being erroneously displayed.

**[0169]** Fig. 28 is a diagram showing screen transition performed in the case where different device icons 501 are successively selected in the display state of the device control screen 502 to successively switch between the device control screens 502. In the upper left diagram, a device control screen 2511 for the air conditioner is displayed. When the device icon 2501 for the refrigerator is selected in this state, a device control screen 2512 for the refrigerator is displayed on the display 101 as shown in the upper right diagram. When the device icon 2502 for the washing machine is selected in the upper left diagram, a device control screen 2513 for the washing machine is displayed as shown in the lower right diagram. When the device icon 2503 for the air purifier is selected in the upper left diagram, a device control screen 2514 for the air purifier is displayed as shown in the lower left diagram. Such screen transition is performed in the same manner in the upper right diagram, the lower right diagram, and the lower left diagram.

**[0170]** Consequently, when the user selects the device icon 501 in the display state of the device control screen

502, the device control screen 502 corresponding to the device icon 501 can be directly displayed. Therefore, in the case where another device control screen 502 is to be displayed while a certain device control screen 502 is displayed, the other device control screen 502 can be displayed with one touch operation without inputting an operation of erasing the device control screen 502 being displayed. This allows the user to smoothly switch between the device control screens 502.

**[0171]** Fig. 29 is a diagram showing an example of display on the basic screen of the device icons 501 for incommunicable devices 200 that cannot be detected on the network. The device management section 105 detects a device 200 that cannot be detected on the network and a device 200 that does not respond to a control command even though registered in the device list 3100 as incommunicable devices 200. Then, the display control section 103 displays the device icons 501 for the incommunicable devices 200 in a display mode that is different from that for the device icons 501 for communicable devices 200.

**[0172]** For example, in Fig. 29, the device icons 501 for the incommunicable devices 200 are represented as device icons 2601. The device icons 2601 are displayed translucently. This allows the user to immediately recognize that the devices 200 indicated by the device icons 2601 are currently out of order or cannot be controlled because of occurrence of a communication failure.

**[0173]** Although the device icons 2601 are displayed translucently in Fig. 29, the embodiment is not limited thereto. For example, the device icons 2601 may be displayed in a fainter color or more darkly than the other device icons 501, or provided with an annotation mark.

**[0174]** Fig. 30 is a diagram showing the configuration of home information 2700. The home information 2700 is managed by the server 300 for each house, and the home controller 100 controls display on the basic screen, the device control screen 502, and so forth on the basis of the home information 2700. As shown in Fig. 30, the home information 2700 includes the floor plan 500, vertex information 2800, the room information 2900, and a device list 4700 managed by the server.

**[0175]** As shown in Fig. 6, the floor plan 500 is a plan view that is prepared for each floor of a house and that planarily represents the arrangement and the shape of one or more rooms forming the floor. In the embodiment, the floor plan 500 includes a plan view formed from image data represented in a bitmap format, for example.

**[0176]** The vertex information 2800 is information for adapting the floor plan 500 to a two-dimensional coordinate-axis space to allow the home controller 100 to interpret the floor plan 500. The room information 2900 is information for deciding the regions of rooms from the vertex information 2800. The vertex information 2800, the room information 2900, and the device list 4700 managed by the server will be described in detail below.

**[0177]** Fig. 31 is a diagram showing the configuration of the vertex information 2800. As shown in Fig. 31, the

vertex information 2800 includes a vertex ID 2801 and a vertex coordinate 2802. The vertex ID 2801 is an identifier that identifies a vertex on the floor plan 500. The vertex coordinate 2802 is a coordinate represented in the format of (X coordinate, Y coordinate, floor number), and indicates the position of a vertex of a partition line or the like represented on the floor plan 500. For example, the vertex with a vertex ID of B has a vertex coordinate (X20, Y0, Z1), which represents the position on the first floor (the ground floor) with an X coordinate of 20 and a Y coordinate of 0.

**[0178]** Fig. 33 is a diagram showing the correlation between each vertex registered in the vertex information 2800 and the floor plan 500. It should be noted, however, that in Fig. 33, the upper left vertex of the floor plan 500 is the origin (with an X coordinate of 0 and a Y coordinate of 0). For example, the vertex with a vertex ID of A has a vertex coordinate (X0, Y0, Z1), and therefore is positioned at the origin. Meanwhile, the vertex with a vertex ID of B has a vertex coordinate (X20, Y0, Z1), and therefore is positioned at the upper right vertex of the bath.

**[0179]** Fig. 32 is a diagram showing the configuration of the room information 2900. As shown in Fig. 32, the room information 2900 includes a room ID 2901, the room type 2902, and a room coordinate 2903. The room ID 2901 is an identifier that identifies a room on the floor plan 500. The room type 2902 indicates the type of the room. The room coordinate 2903 is expressed by a set of the vertex IDs 2801, and decides the region of the room on the floor plan 500. For example, the room with a room ID of C is the bath, and indicates a region formed by connecting the vertexes with vertex IDs of A, B, G, and F sequentially in this order on the floor plan 500. The room information 2900 includes not only information on the rooms but also information on the staircase. The region with a room ID of D formed by connecting the vertexes with vertex IDs of H, I, R, and Q sequentially in this order represents the staircase.

**[0180]** Consequently, with the vertex information 2800 and the room information 2900 provided, the home controller 100 can specify the regions of the rooms represented on the floor plan 500 by plotting the vertexes indicated by the vertex information 2800 on the image data for the floor plan 500 and connecting the vertexes indicated by the room coordinate 2903, and recognize the type of the rooms from the room type 2902.

**[0181]** The vertex information 2800 may be generated by a system administrator by causing the floor plan 500 to be displayed on a display of a personal computer, detecting vertexes from the displayed floor plan, and inputting the vertex ID and the vertex coordinate of the detected vertexes to the personal computer. The vertex information 2900 may also be generated by the system administrator by detecting rooms from the floor plan displayed on a display, and inputting the room ID, the room type, and the room coordinate of the detected rooms to a personal computer. Alternatively, the vertex information 2800 and the room information 2900 may be gener-

ated by taking in CAD data which are the original data for the floor plan 500.

**[0182]** Fig. 34 is a diagram showing the configuration of the device list 4700 managed by the server 300. As shown in Fig. 34, the device list 4700 includes a device ID 4701, a device type 4702, a model number 4703, an arrangement 4704, a capability information 4705, and a control command transmission destination 4706.

**[0183]** The device ID 4701 is the identifier of the device 200. The device type 4702 indicates the type of the device 200. The model number 4703 indicates the model number of the device 200. The arrangement 4704 is a coordinate represented in the format of (X coordinate, Y coordinate, floor number) as with the vertex coordinate 2802, and indicates the arrangement of the device icon 501 corresponding to the device 200 on the floor plan 500.

**[0184]** The display control section 103 can dispose the device icon 501 on the floor plan 500 on the basis of the arrangement 4704, and display the basic screen and so forth. The capability information 4705 indicates the content for control of the device 200 and the state that can be acquired from the device 200. For example, the air conditioner with a device ID of A can be controlled for the temperature, the air flow direction, and the air flow amount. The control command transmission destination 4706 indicates the transmission destination of a control command for controlling the device 200. For example, the control command transmission destination 4706 for the air conditioner with a device ID of A is the device, and therefore a control command is directly transmitted from the home controller 100 to the device 200. Meanwhile, the control command transmission destination 4706 for the refrigerator with a device ID of C is the server, and therefore a control command is transmitted from the home controller 100 to the device 200 via the server 300. The control command is a command for operating the device 200 or confirming the state of the device 200.

**[0185]** The current state of the device 200 may be registered in the device list 4700. This allows the server 300 to notify the home controller 100 of the state of the relevant device 200 in the case where a request for confirmation of the state of the device 200 is made from the home controller 100.

**[0186]** As discussed above, in order to dispose the device icon 501 on the floor plan 500 on the basis of the actual arrangement of the device 200 within the house, the user moves the device icon 501 to an appropriate position on the floor plan 500. Thus, for the device icon 501 of which the arrangement on the floor plan 500 is not specified by the user, a value that indicates an unset arrangement such as (0, 0, 0) is set as the value of the arrangement 4704. The display control section 103 displays the device icon 501 with the arrangement 4704 unset at a position on the display 101 determined in advance.

**[0187]** The device list 4700 managed by the server may be omitted from the home information 2700. In this

case, the home controller 100 may directly acquire from the device 200 information corresponding to the device type 4702, the model number 4703, and the capability information 4705 provided in the device list 4700 managed by the server.

**[0188]** Fig. 35 is a diagram showing the configuration of the device list 3100 managed by the home controller 100. The home controller 100 disposes the device icons 501 on the floor plan 500 in the basic screen and controls the devices 200 on the basis of information in the device list 3100.

**[0189]** The device list 3100 includes the device ID 3101, the device type 3102, a model number 3103, the arrangement 3104, capability information 3105, a control command transmission destination 3106, and an IP address 3107. The device ID 3101 to the control command transmission destination 3106 are the same in content as those with the same name in Fig. 34.

**[0190]** In the device list 3100, the content of the device type 3102, the model number 3103, the arrangement 3104, the capability information 3105, the control command transmission destination 3106 can be acquired by the device management section 105 by transmitting the device list 4700 from the server 300. The IP address 3107 is acquired from the device 200 by the device management section 105. It should be noted, however, that the device management section 105 may give priority to the content of the device type 3102, the model number 3103, the capability information 3105, and the control command transmission destination 3106 that can be directly acquired from the device 200 in the case where such content is available.

**[0191]** The control command transmission destination 3106 may be determined in advance by the home controller system, may be automatically decided on the basis of the state of the network to which the home controller 100 is connected, or may be set by the user, rather than being acquired from the server 300 or the device 200.

**[0192]** Next, the flow of control performed on the device 200 by the home controller 100 will be described using the drawings.

**[0193]** Fig. 36 is a sequence diagram showing the flow of a process for the home controller 100 to acquire the home information 2700 from the server 300. The home controller 100 acquires the home information 2700 from the server 300 at desired timing such as when the home controller 100 is initially utilized or started, and generates the basic screen shown in Fig. 5 on the basis of the acquired home information 2700.

**[0194]** First, the device management section 105 of the home controller 100 transmits a home information request to the server 300 (S3201). Here, the home information request includes at least a home controller ID that indicates a user or a home that utilizes the home controller 100. The home information management section 301 of the server 300 which receives the home information request searches the storage section 304 for the home information 2700 corresponding to the home controller

ID (S3202), and transmits the home information 2700 to the home controller 100 (S3203). The device management section 105 of the home controller 100 stores the home information 2700 received from the server 300 in the storage section 104, and the display control section 103 generates a basic screen on the basis of the home information 2700, and displays the basic screen on the display 101 (S3204).

**[0195]** Next, the flow of a process for the home controller 100 to detect the device 200 on the network after the home controller 100 is connected to the network will be described using Fig. 37.

**[0196]** In Fig. 37, a device A 200 with a device ID of A and a device B 200 of a device ID of B shown in Fig. 31 are connected to the network.

**[0197]** When the home controller 100 is connected to the network when the home controller 100 is initially utilized or turned on (S3301), the device management section 105 of the home controller 100 broadcasts a device search request to all the devices 200 on the network (S3302). The device A 200 which receives the device search request returns a device search response to the home controller 100 (S3303). The home controller 100 which receives the device search response acquires device information from the device A 200 (S3304), and updates the display screen (S3305).

**[0198]** Similarly, the device B 200 which receives the device search request returns a device search response to the home controller 100 (S3306). The home controller 100 which receives the device search response acquires device information from the device B 200 (S3307), and updates the display screen (S3308). Here, the device information is information that represents the device type, the model number, the capability information, and so forth of the device 200. The device management section 105 of the home controller 100 generates the device list 3100 (see Fig. 35) on the basis of the device information.

**[0199]** Next, the flow of a process for the home controller 100 to detect the device 200 on the network when the device 200 is connected to the network will be described using Fig. 38. When the device A 200 is connected to the network when the device A 200 is initially utilized or turned on (S3401), a network connection notification is broadcast to all the home controllers 100 on the network (S3402). In the home controller 100 which receives the network connection notification, the device management section 105 acquires device information from the device A 200 (S3403), and the display control section 103 updates the display screen (S3404). When the device B 200 is connected to the network, the same process as for the device A 200 is performed (S3405 to S3408).

**[0200]** Here, the update of the display screen of the home controller 100 in Figs. 37 and 38 (S3305, S3308, S3404, and S3408) will be described. The home controller 100 hides the device icon 501 corresponding to the device 200 until the device search response or the network connection notification is received from the device 200, that is, until the device 200 is detected on the net-

work. Then, the home controller 100 which receives the device search response displays the device icon 501 for the corresponding device 200 on the screen. Alternatively, the home controller 100 displays the device icon 501 for the undetected device 200 in a faint color (for example, translucently) compared to the device icon 501 for the detected device 200. Then, the home controller 100 which receives the device search response changes the color of the device icon 501 for the undetected device 200 to the same color as the color of the device icon 501 for the detected device 200.

**[0201]** Figs. 39A and 39B are each a flowchart showing the flow of a process for the home controller 100 to control the device 200 according to the present invention.

**[0202]** First, the touch panel control section 102 senses that the device icon 501 representing a certain device 200 is selected by the user on the basic screen (S3501). Next, the display control section 103 retracts all the device icons 501 out of the display region of the device control screen 502 (S3502). In this case, the device icons 501 are retracted as shown in Figs. 11 and 13.

**[0203]** Next, the display control section 103 adjusts the display positions of the retracted device icons 501 (S3503). For example, the selected device icons 501 are adjusted so as to be displayed at particular positions as shown in Figs. 12 and 14.

**[0204]** Next, the display control section 103 judges whether the device control screen 502 corresponding to the device icon 501 selected by the user is a dedicated screen or a floor plan (S3504).

**[0205]** Here, the device control screen 502 which is a dedicated screen refers to the device control screen 502 prepared separately from the floor plan and displayed as overlapped on the floor plan as shown in Fig. 13. On the other hand, the device control screen 502 which is a floor plan refers to the device control screen 502 which is the floor plan itself.

**[0206]** For example, if the illumination device can be turned on and off or adjusted for the brightness by the user by directly tapping on the region of a room on the floor plan in which the illumination device is disposed, the illumination device can be operated with presence. In the case where the user attempts to operate a plurality of illumination devices installed in the living room at the same time, meanwhile, the entire screen is covered by the device control screens 502 dedicated to the illumination devices if the device control screens 502 dedicated to the individual illumination devices are displayed on the floor plan at the same time, which lowers the viewability.

**[0207]** Thus, in the following description, it is assumed that the device control screen 502 for the illumination device is a floor plan. Specifically, when the user selects the device icon 501 for the illumination device installed in a certain room in the basic screen, all the device icons 501 are retracted out of the display region of the floor plan, and the floor plan becomes ready to receive an operation for the illumination device in the room. Then, when the user taps on the region of the room on the floor

plan in which the selected illumination device is installed, one or more illumination devices within the room can be operated at the same time.

**[0208]** For example, when the user taps on the region of a room with the illumination devices in the room turned off, one or more illumination devices in the room are turned on at the same time. Next, when the user taps on the region, the one or more illumination devices are turned off at the same time.

**[0209]** In the case where the device control screen 502 is a floor plan in S3504, and if the region of the room in which the device icon 501 is disposed is equal to or less than a certain size (YES in S3506), the display control section 103 causes the device control screen 502 dedicated to the device in which the region of the room is displayed as enlarged to be displayed as overlapped on the floor plan (S3507). Here, for example, a floor plan formed by clipping the floor plan of the relevant room from the floor plan for the entire floor and enlarging the clipped floor plan is displayed as overlapped on the floor plan for the entire floor.

**[0210]** If the region of the room in which the device icon 501 is disposed is not equal to or less than the certain size (NO in S3506), on the other hand, the display control section 103 displays the floor plan as the device control screen 502 (S3508).

**[0211]** Information as to whether a dedicated screen or a floor plan is adopted as the device control screen 502 for each device 200 is stored in advance in the storage section 104. Thus, the display control section 103 may reference the information to determine whether the device control screen 502 is a dedicated screen or a floor plan.

**[0212]** In addition, the display control section 103 may calculate the size of the relevant room by specifying the vertexes of the relevant room from the room information 2900, specifying the coordinates of the specified vertexes from the vertex information 2800, and calculating the area of a region surrounded by the specified coordinates of the vertexes. Then, the result of determination in S3506 may be NO if the size of the room is not equal to or less than the certain size determined in advance, and the result of determination in S3506 may be YES if the size of the room is equal to or less than the certain size.

**[0213]** In the case where the device control screen 502 is a dedicated screen in S3504, on the other hand, the display control section 103 displays the dedicated screen as overlapped on the floor plan (S3505).

**[0214]** In S3509, the touch panel control section 102 senses that a contacting object (here, a finger of the user) starts contacting the display 101.

**[0215]** Next, the touch panel control section 102 determines whether or not the contact target is the device icon 501 (S3510).

**[0216]** If it is determined that the device icon 501 is contacted (YES in S3510), the touch panel control section 102 determines whether or not the contacting object contacts the same device icon 501 as the device icon

501 selected in S3501 (S3511). In the case where it is determined that the contacting object contacts the same device icon 501 as the device icon 501 selected in S3501 (YES in S3511), the display control section 103 hides the device control screen 502 being displayed to display the basic screen (S3514).

**[0217]** In the case where the touch panel control section 102 determines that the device icon 501 is not contacted (NO in S3510), the touch panel control section 102 further determines whether or not the contact target is the device control screen 502 (S3512). In the case where it is determined that the contact target is not the device control screen 502 (NO in S3512), the display control section 103 hides the device control screen 502 being displayed, and the basic screen is displayed (S3514).

**[0218]** If the touch panel control section 102 determines that the contacting object contacts a button or the like within the device control screen 502 (YES in S3512), on the other hand, the process is advanced to S3513, where a control flow that is specific to the device is executed (S3513).

**[0219]** Next, the control flow that is specific to the device executed in S3513 will be described in detail using Fig. 40. First, the device control section 106 decides the content of control that is specific to the device in accordance with the content of a contact by the contacting object (S3601). Next, the device control section 106 generates a control command according to the content of control (S3602). It is assumed that the user taps on the button for raising the temperature with the device control screen 502 for the air conditioner displayed as shown in Fig. 11 and the touch panel control section 102 senses the tap. Then, the device control section 106 generates a control command for raising the temperature of the air conditioner. Next, the device control section 106 advances the process to S3603, where a control command transmission flow is executed.

**[0220]** Next, the control command transmission flow executed in S3603 will be described in detail using Fig. 41. First, the device control section 106 determines whether or not the home controller 100 is connected to the home network (S3701). If the home controller 100 is connected to the home controller (YES in S3701), the device control section 106 checks the transmission destination of a control command in accordance with the content of the control command transmission destination 3106 of the device list 3100 (S3702). Here, the home network is a network provided within the home of the user. Thus, the result of determination in S3701 is NO if the user operates the home controller 100 from a location away from the home, and the result of determination in S3701 is YES if the user operates the home controller 100 from a location within the home.

**[0221]** If the transmission destination of a control command is "DEVICE" in S3702, the device control section 106 transmits a control command to the relevant device 200 (S3703). If the transmission destination of a control

command is "SERVER" in S3702, on the other hand, the device control section 106 transmits a control command to the server 300 (S3704).

**[0222]** For example, in the device list 3100, the control command transmission destination 3106 of the air conditioner is "DEVICE", and therefore the device control section 106 transmits a control command to the air conditioner. On the other hand, in the device list 3100, the control command transmission destination 3106 of the refrigerator is "SERVER", and therefore the device control section 106 transmits a control command to the server 300.

**[0223]** Meanwhile, in the case where it is judged in S3701 that the home controller 100 is not connected to the home network (NO in S3701), the process in S3704 is performed.

**[0224]** In S3705, the device control section 106 receives the control result from the device 200. Next, in the case where transmission of a control command to all the devices 200 that are operated at the same time is completed (YES in S3706), the device control section 106 advances the process to S3707. In the case where transmission of a control command to all the devices 200 that are operated at the same time is not completed (NO in S3706), on the other hand, the device control section 106 returns the process to S3702, and repeats the processes in and after S3702.

**[0225]** For example, in the case where two illumination devices are installed in the same room and the two illumination devices are set in advance to be operated at the same time, the device control section 106 transmits a control command to each of the two illumination devices. The result of determination in S3706 is NO for devices 200 that are not operated at the same time as other devices 200.

**[0226]** Next, the display control section 103 updates the screen displayed on the display 101 (S3707). For example, if the set temperature of the air conditioner is changed, the device control screen 502 is updated such that the temperature display is flashed on and off, for example, until the set temperature of the air conditioner is changed by a control command and the temperature display stops flashing when the set temperature of the air conditioner is changed by a control command. In the example of the illumination device, the screen is updated such that the region on the floor plan of a room in which the illumination device is installed becomes brighter than other regions in the case where the illumination device is turned on.

**[0227]** Next, the flow of a process for the home controller 100 to directly control the device 200 will be described using Fig. 42. First, the touch panel control section 102 of the home controller 100 senses a user operation on the device control screen 502 (S3801). Next, the device control section 106 of the home controller 100 generates a control command according to the user operation, and transmits the control command to the device 200 (S3802).

**[0228]** The device 200 which receives the control command executes the control command (S3803), and transmits the control result to the home controller 100 (S3804). The display control section 103 of the home controller 100 which receives the control result updates the display screen in accordance with the control result (S3805).

**[0229]** Next, the flow of a process for the home controller 100 to control the device 200 by way of the server 300 will be described using Fig. 43. First, the touch panel control section 102 of the home controller 100 senses a user operation on the device control screen 502 (S3901). Next, the device control section 106 of the home controller 100 generates a control command according to the user operation, and transmits the control command to the server 300 (S3902).

**[0230]** The server 300 which receives the control command transmits the relevant control command to the device 200 (S3903). The device 200 which receives the control command executes the control command (S3904), and transmits the control result to the server 300 (S3905). The server 300 which receives the control result transmits the control result to the home controller 100 (S3906). The display control section 103 of the home controller 100 which receives the control result updates the display screen in accordance with the control result (S3907).

**[0231]** Next, the flow of a process for the home controller 100 to confirm the device state of the device 200 by way of the server 300 will be described using Fig. 44. First, the device 200 transmits the current device state to the server 300 (S4001). Here, the device 200 transmits the device state to the server 300 when the device 200 is turned on, when the device 200 is turned off, when the device state is changed, or regularly to cause the server 300 to store the device state. The process in S4001 may be executed asynchronously with the processes in S4002 to S4006.

**[0232]** Next, the touch panel control section 102 of the home controller 100 senses a user operation on the device control screen 502 (S4002). Next, the device control section 106 of the home controller 100 generates a control command according to the user operation, and transmits the control command to the server 300 (S4003). Here, a control command for confirming the device state of the device 200 is generated.

**[0233]** The server 300 which receives the control command searches for the current device state of the relevant device 200 (S4004), and transmits the device state of the relevant device 200 to the home controller 100 as the control result (S4005). The display control section 103 of the home controller 100 which receives the control result updates the display screen in accordance with the control result (S4006). For example, if the device control screen 502 for the device 200 is displayed on the display 101, the content of the device control screen 502 for the device 200 is updated in accordance with the control result.

**[0234]** Next, the flow of a process for the home con-

troller 100 to directly control the devices 200 in the case where the home controller 100 controls a plurality of devices 200 with one operation will be described using Fig. 45. Here, a case where the home controller 100 controls the device A 200 and the device B 200 is described as an example.

**[0235]** First, the touch panel control section 102 of the home controller 100 senses a user operation on the device control screen 502 (S4101). Next, the device control section 106 of the home controller 100 generates a control command according to the user operation, and transmits the control command to the device A 200 (S4102).

**[0236]** The device A 200 which receives the control command executes the control command (S4103), and transmits the control result to the home controller 100 (S4104).

**[0237]** Next, the device control section 106 of the home controller 100 transmits to the device B 200 a control command that is the same as the control command transmitted to the device A 200 (S4105). The device B 200 which receives the control command executes the control command (S4106), and transmits the control result to the home controller 100 (S4107).

**[0238]** The display control section 103 of the home controller 100 which receives the control result updates the display screen in accordance with the control result (S4108). In this case, for example, if the device control screens 502 for the devices A 200 and B 200 are displayed on the display 101, the content of the device control screens 502 for the devices A 200 and B 200 is updated in accordance with the control result.

**[0239]** Next, the flow of a process for the home controller 100 to control the devices 200 by way of the server 300 in the case where the home controller 100 controls a plurality of devices 200 with one operation will be described using Fig. 46. Here, a case where the home controller 100 controls the device A 200 and the device B 200 is described as an example. In addition, it is assumed that the devices A 200 and B 200 are represented by one device icon 501, and controlled using one device control screen 502.

**[0240]** First, the touch panel control section 102 of the home controller 100 senses a user operation on the device control screen 502 (S4201).

**[0241]** Next, the device control section 106 of the home controller 100 generates a control command for the device A 200 according to the user operation, and transmits the control command to the server 300 (S4202).

**[0242]** The server 300 which receives the control command for the device A 200 transmits the control command to the device A 200 (S4203). The device A 200 which receives the control command executes the control command (S4204), and transmits the control result to the server 300 (S4205). The server 300 which receives the control result transmits the control result to the home controller 100 (S4206).

**[0243]** Similarly, the device control section 106 of the home controller 100 generates a control command for

the device B 200 according to the user operation, and transmits the control command to the server 300 (S4207).

**[0244]** The server 300 which receives the control command transmits the control command to the device B 200 (S4208). The device B 200 which receives the control command executes the control command (S4209), and transmits the control result to the server 300 (S4210). The server 300 which receives the control result transmits the control result to the home controller 100 (S4211).

**[0245]** Then, the display control section 103 of the home controller 100 updates the display screen in accordance with the control result (S4212).

**[0246]** Next, the flow of a process for the home controller 100 to control the devices 200 by way of the server 300 in the case where the home controller 100 controls a plurality of devices 200 with one operation will be described using Fig. 47. Here, a case where the home controller 100 controls the device A 200 and the device B 200 is described as an example. In addition, it is assumed that the devices A 200 and B 200 are represented by one device icon 501, and controlled using one device control screen 502.

**[0247]** First, the touch panel control section 102 of the home controller 100 senses a user operation on the device control screen 502 (S4301).

**[0248]** Next, the device control section 106 of the home controller 100 generates a control command for the device A 200 and the device B 200 in accordance with the user operation, and transmits the control command to the server 300 (S4302).

**[0249]** The server 300 which receives the control command transmits the control command to the device A 200 (S4303). The device A 200 which receives the control command executes the control command (S4304), and transmits the control result to the server 300 (S4305).

**[0250]** Similarly, the server 300 transmits the control command to the device B 200 (S4306). The device B 200 which receives the control command executes the control command (S4307), and transmits the control result to the server 300 (S4308). The server 300 which receives the control result for the device A 200 and the device B 200 transmits the control result to the home controller 100 (S4309).

**[0251]** Then, the display control section 103 of the home controller 100 updates the display screen in accordance with the control result (S4310).

**[0252]** Next, the flow of a process for a case where the device icon 501 is moved in the home controller 100 will be described using Fig. 48. Here, it is assumed that the user owns two home controllers A 100 and A 200.

**[0253]** When the touch panel control section 102 of the home controller A 100 senses movement of the device icon 501 (S4801), the display control section 103 updates the display screen (S4802). Here, the display control section 103 displays the device icon 501 moved in accordance with the amount of a drag performed on the device icon 501 by the user.

**[0254]** The device management section 105 of the home controller A 100 transmits to the server 300 a device list update notification including the coordinate on the floor plan 500 after the drag (S4803). Here, the device management section 105 of the home controller A 100 updates the content of the arrangement 3104 of the relevant device 200 in the device list 3100 managed by the device management section 105 itself with the coordinate after the drag.

**[0255]** The server 300 which receives the device list update notification updates the device list 4700 (S4804). In this case, the home information management section 301 of the server 300 updates the content of the arrangement 4704 of the relevant device 200 in the device list 4700 with the coordinate included in the device list update notification.

**[0256]** Subsequently, the server 300 transmits the device list update notification to the home controller B 100 (S4805). The home controller B 100 which receives the device list update notification updates the display screen (S4806). Here, the device management section 105 of the home controller B 100 updates the content of the arrangement 3104 of the relevant device 200 in the device list 3100 managed by the device management section 105 itself with the coordinate included in the device list update notification.

**[0257]** The device icon 501 is disposed at an appropriate position on the floor plan 500 through the process described above. Because the home controller B 100 is notified of the update of the arrangement position of the device icon 501 performed by the home controller A 100 by way of the server 300, the arrangement position of the device icon 501 after the update is shared among the home controllers A 100 and B 100 and the server 300. Therefore, it is possible to avoid trouble in which the arrangement position of the device icon 501 is different between the home controller A 100 and the home controller B 100.

**[0258]** Next, an example of a process for updating the device lists of the home controller 100 and the server 300 will be described using Fig. 49. The device 200 transmits the device state indicating the current state of the device 200 itself to the server 300 (S4901). Here, the device 200 may regularly transmit the device state, or may transmit the device state when the state is varied. The server 300 updates the device list 4700 in accordance with the content of the received device state (S4902). Here, in the case where the device list 4700 does not contain information on the device 200, the server 300 adds information on the device 200 as a new device. Then, the server 300 transmits a device list update notification to the home controller 100 (S4903). The device management section 105 of the home controller 100 updates the device list 3100 in accordance with the content of the received device list update notification (S4904). Here, in the case where the device list 3100 does not contain information on the device 200, the device management section 105 adds information on the device 200 as a new device.

Then, the display control section 103 of the home controller 100 updates the display screen (S4905).

**[0259]** Consequently, the server 300 is notified of variation in state of the device 200, which allows the server 300 to monitor variation in state of the device 200. The server 300 to which the device state is transmitted from the device 200 notifies the home controller 100 of variation in state of the device 200, which allows the home controller 100 to recognize the current state of the device 200. In the case where a new device 200 is connected to the home network, the server 300 and the home controller 100 can add the new device. Hence, it is possible to prevent occurrence of deviation between the actual state of the device 200 and the state of the device 200 recognized by the home controller 100.

**[0260]** Next, another example of the process for updating the device lists of the home controller 100 and the server 300 will be described using Fig. 50. The device 200 transmits the device state to the home controller 100 (S5001). Here, the device 200 may regularly transmit the device state, or may transmit the device state when the state is varied.

**[0261]** The device management section 105 of the home controller 100 updates the device list 3100 in accordance with the content of the received device state (S5002). Here, in the case where the device list 3100 does not contain information on the device 200, the device management section 105 adds information on the device 200 as a new device. Then, the display control section 103 updates the display screen (S5003). Then, the device management section 105 of the home controller 100 transmits a device list update notification to the server 300 (S5004). The server 300 updates the device list 4700 in accordance with the received device list update notification (S5005). Here, in the case where the device list 4700 does not contain information on the device 200, the server 300 adds information on the device 200 as a new device.

**[0262]** Next, still another example of a process in which the home controller 100 and the server 300 update the device list will be described using Fig. 51. In Fig. 51, a case where the user owns two home controllers 100, namely an in-home home controller 100 and an out-home home controller 100, is described as an example. Here, the out-home home controller 100 is a home controller 100 taken away from the home by the user, and the in-home home controller 100 is a home controller 100 kept at the home by the user.

**[0263]** The device 200 transmits the device state to the in-home home controller 100 (S5101). The in-home home controller 100 updates the device list 3100 in accordance with the content of the received device state (S5102). Here, in the case where the device list 3100 does not contain information on the device 200, the device management section 105 adds information on the device 200 as a new device. Then, the display screen is updated (S5103). Then, the in-home home controller 100 transmits a device list update notification to the server

300 (S5104).

**[0264]** The server 300 updates the device list 4700 in accordance with the content of the received device list update notification (S5105). Here, in the case where the device list 4700 does not contain information on the device 200, the server 300 adds information on the device 200 as a new device. Then, the server 300 transmits a device list update notification to the out-home home controller 100 (S5106). The out-home home controller 100 updates the device list 3100 in accordance with the content of the received device list update notification (S5107). Here, in the case where the device list 3100 does not contain information on the device 200, the device management section 105 of the out-home home controller 100 adds information on the device 200 as a new device. Then, the display screen is updated (S5108).

**[0265]** According to the example, even in the case where one home controller 100 is located away from the home and the other home controller 100 is located in the home, it is possible to prevent occurrence of deviation between the states of the device 200 recognized by the two home controllers 100.

**[0266]** The sequences and the process flows described above are merely exemplary, and the order of the steps may be changed and some of the steps may be omitted as long as the intended process may be embodied. For example, a control command may be transmitted to the device A 200 and the device B 200 asynchronously.

**[0267]** In the foregoing description, a plan view that planarily represents the position and the shape of rooms forming each floor is adopted as the floor plan 500. However, the embodiment is not limited thereto, and a diagram that schematically shows how many rooms of what type are located on each floor may be adopted as the floor plan.

**[0268]** Floor plans in other patterns will be specifically described below. Fig. 52 is a diagram showing a floor plan 5200 in another pattern. In the floor plan 5200, rooms forming one floor are each represented by one rectangular block, and the rooms on the one floor are disposed in a matrix. The blocks have the same size, and are each provided with the name of the room.

**[0269]** In the floor plan 5200, the name and the number of the rooms forming each floor are indicated, but the relative size and the position in the floor of the rooms are not represented. In the embodiment, such a diagram is treated as the floor plan 5200. That is, in the embodiment, any diagram that represents at least what rooms are provided on each floor are treated as the floor plan.

**[0270]** For example, it is seen that a floor plan 5201 for the first floor includes rooms such as a living room, a kitchen, a dining room, a bath, a lavatory, a toilet, a staircase, and a hallway. Meanwhile, it is seen that a floor plan 5202 for the second floor includes rooms such as a main bedroom, a bedroom 1, a bedroom 1, a child's room, and a staircase.

**[0271]** The user can drag and move a desired room on

the floor plan 5200 to change the position of the room on the floor plan 5200. In the case where a large number of devices 200 are disposed within a room and all the device icons 501 cannot be displayed within the room on the floor plan 5200 using a default room size, the display control section 103 may increase the size of the room such that all the device icons 501 can be accommodated within the room.

**[0272]** Fig. 53 is a diagram showing the configuration of a basic screen that adopts the floor plan 5200. The floor plan 5200 is displayed on the basic screen. In addition, the device icons 501 for the devices 200 actually disposed are displayed within each room.

**[0273]** For example, the device icons 501 for the television set and the illumination device are displayed in the living room, and therefore it is seen that the television set and the illumination device are installed in the living room.

**[0274]** The device list display change button 503 is a button for switching the screen display from the basic screen to the device list display screen discussed earlier (see Fig. 24).

**[0275]** Fig. 54 is a diagram showing the display state of the device control screen 502 for a case where the floor plan 5200 shown in Fig. 52 is adopted. In the basic screen shown in Fig. 53, when the touch panel control section 102 senses that the user selects the device icon 501, the display control section 103 causes the display 101 to display the device control screen 502 corresponding to the selected device icon 501. In Fig. 54, the device icon 501 for the air conditioner is selected, and therefore the device control screen 502 for the air conditioner is displayed as overlapped on the floor plan 5200.

**[0276]** In displaying the device control screen 502, the display control section 103 disposes the device icons 501 displayed on the floor plan 5200 outside the display region of the device control screen 502. In the example of Fig. 54, all the device icons 501 are disposed in one vertical line on the left side of the floor plan 5200.

**[0277]** In disposing the device icons 501 in one vertical line on the left side of the floor plan 5200, the display control section 103 may group the device icons 501 under particular conditions. For example, the device icons 501 may be grouped in accordance with the room, may be grouped in accordance with the type of the device 200, or may be grouped in accordance with the category based on the type of the device 200.

**[0278]** In the example of Fig. 54, the device icons 501 are disposed on the left side of the floor plan 5200. However, the device icons 501 may be disposed in one vertical line on the right side of the floor plan 5200, or may be disposed in one horizontal line on the upper or lower side of the floor plan 5200.

**[0279]** In the case where all the device icons 501 cannot be displayed on the left side of the floor plan 5200, the display control section 103 may scroll the device icons 501 upward or downward in accordance with a swipe operation performed upward or downward on the device icons 501 disposed in one line on the left side to cause

the device icons 501, which have been hidden, to be displayed within the display 101.

**[0280]** In disposing the device icons 501 in one vertical line on the left side of the floor plan 5200, the display control section 103 may display the device icon 501 selected by the user in a display mode that is different from that for the unselected device icons 501. For example, the selected device icon 501 may be displayed in a color that is different from that of the unselected device icons 501, may be displayed more brightly than the unselected device icons 501, may be displayed more densely than the unselected device icons 501, or may be flashed on and off at a constant cycle.

**[0281]** The display control section 103 may scroll an array of the device icons 501 such that the device icon 501 selected by the user is positioned at a conspicuous position (for example, the top, middle, or bottom position) in the line of icons.

**[0282]** In displaying the device control screen 502, the display control section 103 may dispose all the device icons 501 on the outer periphery of an ellipse as shown in Fig. 12.

**[0283]** Next, transition between the display state of the basic screen and the display state of the device control screen 502 will be described using Fig. 55.

**[0284]** In the basic screen shown in the left diagram of Fig. 55, the user selects the device icon 501 for the device 200 (here, the air conditioner) that is desired to be controlled, and the touch panel control section 102 senses the selection. Then, as shown in the right diagram of Fig. 55, the display control section 103 displays the device control screen 502 corresponding to the selected device icon 501 as overlapped on the floor plan 5200. This results in transition from the display state of the basic screen to the display state of the device control screen 502.

**[0285]** On the other hand, as shown in the right diagram of Fig. 55, in the display state of the device control screen 502, the user selects the device icon 501 for the air conditioner corresponding to the device control screen 502 or a location outside the display region of the device control screen 502 (for example, the display region of the floor plan 5200 outside the display region of the device control screen 502), and the touch panel control section 102 senses the selection. Then, as shown in the left diagram of Fig. 55, the display control section 103 erases the device control screen 502, and returns from the display state of the device control screen 502 to the display state of the basic screen.

**[0286]** Fig. 56 is a diagram showing the configuration of a floor plan 5600 for a case where the size of each block is varied in accordance with the actual room size in the floor plan 5200 shown in Fig. 52.

**[0287]** In the left diagram of Fig. 56, a floor plan 5601 for the first floor is shown. In the right diagram of Fig. 56, a floor plan 5602 for the second floor is shown.

**[0288]** In the floor plan 5601 for the first floor, the living room is the largest in terms of the room size, and is fol-

lowed by the kitchen, the bath, and the staircase. Therefore, the sizes of the rooms are displayed in this order. Also in the floor plan 5602 for the second floor, the rooms are represented in accordance with the actual room size.

5 In this case, information that indicates the actual room size may be registered in advance in room information 6800 to be discussed later, and the display control section 103 may decide the size of each room in accordance with the information.

10 **[0289]** Fig. 57 is a diagram showing the configuration of a basic screen that adopts the floor plan 5600 shown in Fig. 56. In the floor plan 5600, each room is displayed with a size matching the actual size. In addition, the device icons 501 for the devices 200 actually disposed are displayed in each room.

15 **[0290]** In the case where the mode in which each room is represented with a size matching the actual room size on the floor plan 5600 is adopted, displaying all the rooms within the display 101 may result in small display of the rooms to make a user operation difficult. Thus, a room display button 5603 with a text "DISPLAY OTHER ROOMS" is provided in Fig. 57.

20 **[0291]** When the user selects the room display button and the touch panel control section 102 senses the selection, the display control section 103 switches the screen display to the floor plan 5600 which displays the remaining rooms.

25 **[0292]** In the example of Fig. 57, the floor plan 5600 is partitioned into the floor plan 5601 for the first floor and the floor plan 5602 for the second floor. Therefore, when the room display button 5603 is selected, the display control section 103 switches display on the display 101 to the floor plan 5602 for the second floor. In this case, the room display button 5603 is also provided on the floor plan 5602 for the second floor. Therefore, when the room display button 5603 is selected, the display control section 103 switches display on the display 101 to the floor plan 5601 for the first floor.

30 **[0293]** Although the floor plan is provided for each floor in the example of Fig. 57, the embodiment is not limited thereto. For example, in the case where the floor plan 5601 for the first floor cannot be displayed on the display 101 at the same time, the display control section 103 may divide the floor plan 5601 for the first floor, and display a divided portion of the floor plan 5601 on the display 101. In this case, when the room display button 5603 is selected, a hidden portion of the floor plan 5601 for the first floor may be displayed.

35 **[0294]** In the case where the floor plan 5601 for the first floor and the floor plan 5602 for the second floor can be displayed on the display 101 at the same time, the display control section 103 may display the floor plan 5601 for the first floor and the floor plan 5602 for the second floor on the display 101 at the same time. In this case, the room display button 5603 is omitted from the floor plan 5600.

40 **[0295]** In the case where the staircase is tapped on on the floor plan 5600, the display control section 103 may

switch between the floor plan 5601 for the first floor and the floor plan 5602 for the second floor.

**[0296]** Fig. 58 is a diagram showing the display state of the device control screen 502 for a case where the floor plan 5600 shown in Fig. 56 is adopted as the floor plan. In Fig. 58, as in Fig. 54, the device control screen 502 for the air conditioner is displayed. Fig. 58 is otherwise the same as Fig. 54, and therefore is not described.

**[0297]** Fig. 59 is a diagram showing a floor plan 5900 in still another pattern according to the embodiment of the invention. The floor plan 5900 of Fig. 59 is the same as the floor plan 5200 in that rooms are represented by blocks of the same size, but is different from the floor plan 5200 in arrangement of the rooms. Specifically, in the floor plan 5900, the floor numbers are displayed in the vertical direction, and the rooms forming the same floor are arranged in one horizontal line. In the example of Fig. 59, the house has three floors, namely the first floor to the third floor, and therefore the rooms forming the third floor are disposed in the first line, the rooms forming the second floor are disposed in the second line, and the rooms forming the first floor are disposed in the third line. The floor number such as 1F, 2F, and 3F is indicated at the left end of each line. It is seen at a glance from the floor plan 5900 on which floor each room is disposed.

**[0298]** Also in the floor plan 5900, the size of each room may be varied in accordance with the actual room size. In the floor plan 5900, in addition, in the case where all the rooms cannot be displayed within the display region of the display 101, the floor plan 5900 may be scrolled in the horizontal direction so that a desired room can be displayed on the display 101.

**[0299]** For example, in the case where there are further rooms on the second floor, when the touch panel control section 102 senses that the user performs a swipe operation from the left to the right, the display control section 103 may scroll the rooms forming the second floor, or the rooms forming the first floor to the third floor, from the left to the right in accordance with the amount of the swipe operation.

**[0300]** Fig. 60 is a diagram showing the configuration of a basic screen that adopts the floor plan 5900 shown in Fig. 59. The floor plan 5900 is displayed on the basic screen. In addition, the device icons 501 for the devices 200 actually disposed are displayed within each room. The device list display change button 503 is a button for switching the screen display from the basic screen to the device list display screen discussed earlier (see Fig. 24).

**[0301]** Fig. 61 is a diagram showing the display state of the device control screen 502 for a case where the floor plan 5900 shown in Fig. 59 is adopted. In the basic screen shown in Fig. 60, when the touch panel control section 102 senses that the user selects the device icon 501, the display control section 103 causes the display 101 to display the device control screen 502 corresponding to the selected device icon 501. In Fig. 61, the device icon 501 for the air conditioner is selected, and therefore

the device control screen 502 for the air conditioner is displayed as overlapped on the floor plan 5900. In displaying the device control screen 502, the display control section 103 disposes the device icons 501 displayed on the floor plan 5900 outside the display region of the device control screen 502. In the example of Fig. 61, all the device icons 501 are disposed in one horizontal line on the lower side of the floor plan 5900.

**[0302]** In disposing the device icons 501 in one vertical line on the lower side of the floor plan 5900, the display control section 103 may group the device icons 501 under particular conditions. For example, the device icons 501 may be grouped in accordance with the room, may be grouped in accordance with the type of the device 200, or may be grouped in accordance with the category based on the type of the device 200.

**[0303]** In the example of Fig. 61, the device icons 501 are disposed on the lower side of the floor plan 5900. However, the device icons 501 may be disposed in one horizontal line on the upper side of the floor plan 5900, or may be disposed in one vertical line on the left or right side of the floor plan 5900.

**[0304]** In the case where all the device icons 501 cannot be disposed on the lower side of the floor plan 500, the display control section 103 may scroll the device icons 501 leftward or rightward in accordance with a swipe operation performed leftward or rightward on the device icons 501 disposed in one horizontal line on the lower side to cause the device icons 501, which have been hidden, to be displayed within the display 101.

**[0305]** In disposing the device icons 501 in one horizontal line on the lower side of the floor plan 5900, the display control section 103 may display the device icon 501 selected by the user in a display mode that is different from that for the unselected device icons 501. For example, the selected device icon 501 may be displayed in a color that is different from that of the unselected device icons 501, may be displayed more brightly than the unselected device icons 501, may be displayed more densely than the unselected device icons 501, or may be flashed on and off at a constant cycle.

**[0306]** The display control section 103 may scroll an array of the device icons 501 such that the device icon 501 selected by the user is positioned at a conspicuous position (for example, the leftmost, middle, or rightmost position) in the line of icons.

**[0307]** In displaying the device control screen 502, the display control section 103 may dispose all the device icons 501 on the outer periphery of an ellipse as shown in Fig. 12.

**[0308]** In the floor plan 5900, the rooms on all the floors are displayed on the display 101 at the same time, which may result in small display of the rooms to make a user operation difficult. Thus, the display control section 103 may display the floor plan 5900 as enlarged in accordance with the user operation. Specifically, when the user performs an operation of pinching out on a certain room in the floor plan 5900 and the touch panel control section

102 senses the operation, the display control section 103 may display the room on the display 101 as enlarged at an enlargement scale matching the amount of the pinch out.

**[0309]** Fig. 62 is a diagram showing a floor plan that displays a certain room in the floor plan 5900 as enlarged. As shown in Fig. 62, the display control section 103 may display a plan view that planarily represents the shape of the relevant room as overlapped on the floor plan 5900. Alternatively, the display control section 103 may switch to displaying the plan view. This allows the user to grasp the configuration of the rooms in the house and the devices 200 disposed in each room on the floor plan 5900 shown in Fig. 60, and to grasp the actual arrangement position of the devices 200 in the enlarged room on the floor plan 5900 shown in Fig. 62.

**[0310]** In the floor plan 5900 not displayed as enlarged shown in Fig. 60, it is not necessary for the display control section 103 to display the device icons 501 for all the devices 200 disposed within the rooms, and the display control section 103 may display only some of the device icons 501.

**[0311]** In this case, the display control section 103 may display one or a plurality of (for example, two) device icons 501 frequently used by the user on the floor plan 5900. Alternatively, the display control section 103 may not display the device icons 501 on the floor plan 5900 not displayed as enlarged. This prevents the viewability of the floor plan 5900 from being lowered because of an increased number of the device icons 501 displayed on the floor plan 5900 not displayed as enlarged.

**[0312]** Fig. 63 is a diagram showing the display state of the device control screen 502 in the floor plan 5900 displayed as enlarged shown in Fig. 62. In Fig. 63, as in Fig. 54, the device control screen 502 for the air conditioner is displayed. In Fig. 63, only the device icons 501 disposed in the room (living room) displayed as enlarged are displayed on the left side of the plan view and in the block of the living room. In the example of Fig. 62, the device icons 501 for the air conditioner, the illumination device, and the television set are displayed in the living room within the plan view, and the device icon 501 for the air conditioner is selected by the user. Therefore, the device icons 501 are displayed in one vertical line on the left side of the plan view.

**[0313]** In the case where a certain room is displayed as enlarged, it is highly likely that the user operates the device 200 disposed within the room. In the case where a certain room is displayed as enlarged, in addition, the device icons 501 for devices in the other rooms are not displayed on the display 101. Therefore, if the device icons 501 for devices disposed in the other rooms are displayed on the left side of the plan view when the user selects a certain device icon 501, the user may be given a sense of wrongness.

**[0314]** Thus, in the case where a certain room is displayed as enlarged, the display control section 103 causes only the device icons 501 for the devices 200 disposed

in the room to be displayed in one vertical line on the left side of the plan view. In the example of Fig. 64, the device icons 501 are displayed on the left side of the plan view. However, the device icons 501 may be displayed in one vertical line on the right side of the plan view, or may be displayed in one horizontal line on the upper or lower side of the plan view.

**[0315]** Fig. 64 is a diagram showing screen transition from the display state of the basic screen to the display state of the device control screen 502. It is assumed that the user taps on the device icon 501 for the air conditioner, for example, in the basic screen which displays the floor plan 5900 not displayed as enlarged as shown in the upper left diagram of Fig. 64. Then, as shown in the upper right diagram of Fig. 64, the display control section 103 displays the device control screen 502 for the air conditioner as overlapped on the basic screen. In the screen shown in the upper right diagram of Fig. 64, on the other hand, when the user taps on a region on the floor plan 5900 other than the device control screen 502 or taps on the device icon 501 for the air conditioner, the display control section 103 returns the screen display to the basic screen shown in the upper left diagram of Fig. 64.

**[0316]** It is assumed that the user pinches out on the living room in the basic screen shown in the upper left diagram of Fig. 64. Then, as shown in the lower left diagram of Fig. 64, the display control section 103 enlarges the block of the living room, and at the same time displays the plan view of the living room having a size matching the size of the enlarged block as overlapped on the enlarged block. It is assumed that the user pinches in on the living room in the lower left diagram of Fig. 64. Then, the display control section 103 returns the screen display to the basic screen shown in the upper left diagram of Fig. 64.

**[0317]** When the device icon 501 for the air conditioner, for example, is selected in the basic screen shown in the lower left diagram of Fig. 64, the display control section 103 displays the device control screen 502 for the air conditioner as overlapped on the plan view as shown in the lower right diagram of Fig. 64. In the lower right diagram of Fig. 64, when the user taps on a region on the floor plan 5900 other than the device control screen 502 or on the device icon 501 for the air conditioner, the display control section 103 returns the screen display to the screen shown in the lower left diagram of Fig. 64.

**[0318]** Fig. 65 is a diagram showing the configuration of a basic screen 5900 which adopts the floor plan shown in Fig. 59 and in which device icons 501 are not displayed. In the mode shown in Fig. 65, only rooms forming each floor are displayed, and the device icons 501 are not displayed.

**[0319]** Fig. 66 is a diagram showing screen transition from the display state of the basic screen to the display state of the device control screen 502 for a case where the basic screen in which device icons 501 are not displayed is adopted. It is assumed that the user pinches

out on the living room, for example, in the basic screen shown in the upper left diagram of Fig. 66. Then, as shown in the lower left diagram of Fig. 66, the display control section 103 displays the block of the living room as enlarged, and displays the plan view of the living room as overlapped on the block displayed as enlarged. It is assumed that the user taps on the device icon 501 for the air conditioner, for example, in the screen shown in the lower left diagram of Fig. 66. Then, as shown in the lower right diagram of Fig. 66, the display control section 103 displays the device control screen 502 for the air conditioner as overlapped on the plan view of the living room, and disposes the device icons 501 for the living room in one vertical line on the left side of the plan view of the living room. In the lower right diagram of Fig. 66, when the user taps on a region on the floor plan 5900 and outside the display region of the device control screen 502, the display control section 103 returns the display screen to the screen shown in the lower left diagram of Fig. 66.

**[0320]** Fig. 67 is a diagram showing the configuration of the home information 2700 for a case where the floor plan 5200 shown in Fig. 52 is adopted. As shown in Fig. 67, the home information 6400 includes the floor plan 5200, the room information 6800, and the device list 4700 managed by the server. In the floor plan 5200, the display positions of the rooms are determined in advance. Therefore, the vertex information 2800 included in the home information 2700 is omitted from the home information 6400.

**[0321]** The floor plan 5200 is image data obtained by representing the floor plan 5200 shown in Fig. 52 in a bitmap format, for example. Alternatively, the floor plan 5200 may be information that prescribes the color, the shape, the size, and so forth for displaying the floor plan 5200. The room information 6800 is information for deciding the regions of rooms from the floor plan 5200.

**[0322]** Fig. 68 is a diagram showing the configuration of room information 6800 shown in Fig. 67. As shown in Fig. 68, the room information 6800 includes a room ID 6801, a room type 6802, a floor level 6803, and a display position 6804. The room ID 6801 is an identifier that identifies a room on the floor plan 5200. The room type 6802 indicates the type of the room. The floor level 6803 indicates the floor level (floor) on which the room is disposed. The display position 6804 indicates the arrangement position of the room on the floor plan 5200.

**[0323]** Fig. 69 is a diagram showing an example of the correspondence between the display position 6804 in the room information 6800 and the floor plan 5200. As shown in Fig. 69, the order of the blocks on the floor plan 5200 is prescribed such that the block in the first row and the first column corresponds to the first cell, the block in the first row and the second column corresponds to the second cell, the block in the first row and the third column corresponds to the third cell, the block in the second row and the first column corresponds to the fourth cell, and so forth.

**[0324]** For example, the room with a room ID 6801 of A has a display position 6804 of "FIRST CELL ON FIRST FLOOR". Therefore, as shown in Fig. 69, the display control section 103 interprets the block in the first cell (in the first row and the first column) on the floor plan 5201 for the first floor as the living room.

**[0325]** In the example of Fig. 69, the blocks are disposed in three horizontal lines, and therefore the cell in the second row and the first column corresponds to the fourth cell, and the cell in the third row and the first column corresponds to the seventh cell. It should be noted, however, that this is merely exemplary. For example, in the case where the cells are arranged in four columns in the horizontal direction, the correlation between the order of the cells and the arrangement positions of the blocks is changed as appropriate in accordance with the number of blocks in the horizontal direction, and the cell in the second row and the first column corresponds to the fifth cell, and the cell in the third row and the first column corresponds to the ninth cell.

**[0326]** Fig. 70 is a diagram showing the configuration of a device list 4700 managed by the server 300 for a case where the floor plan 5200 shown in Fig. 52 is adopted. It is not necessary for the floor plan 5200 to indicate the arrangement position of the device 200 in the room. Therefore, in the device list 4700 shown in Fig. 70, unlike Fig. 34, the room type 6802 is registered in the arrangement 4704. The device list 4700 shown in Fig. 70 is otherwise the same as the device list 4700 shown in Fig. 34. For example, the air conditioner with a device ID 4701 of A is disposed in the living room, and therefore "LIVING ROOM" is registered in the arrangement 4704. In the example of Fig. 70, the room type 6802 is adopted as the arrangement 4704. However, any other information that specifies a room may be registered. For example, the room ID 6801 may be adopted as the arrangement 4704.

**[0327]** Fig. 71 is a diagram showing the configuration of a device list 3100 managed by the home controller 100 for a case where the floor plan 5200 shown in Fig. 52 is adopted. Also in the device list 3100 of Fig. 71, for the same reason as that for the device list 4700 of Fig. 70, the room type 6802 is registered in the arrangement 3104. The device list 3100 of Fig. 71 is otherwise the same as the device list 3100 shown in Fig. 35. Also in Fig. 71, the room ID 6801 may be adopted as the arrangement 3104.

**[0328]** Next, the device list 3100 for a case where the plan view of a certain room is displayed in the case where a pinch-out operation is performed on the room on the basic screen of the floor plan 5900 as shown in Fig. 62 will be described. In this case, the room information 6800 shown in Fig. 68 may include an item of the plan view of the room. Then, image data for the plan view of the relevant room may be registered in the item of the plan view of the room. For the plan view of the room, as shown in Fig. 33, the origin may be set at the left end of the room, for example, the X axis and the Y axis may be set in the

horizontal direction and the vertical direction, respectively, and the position of the room may be represented by the X and Y coordinates.

**[0329]** Meanwhile, not only the room type 6802 but also the coordinate in the room is registered in the arrangement 3104 of the device list 3100 shown in Fig. 71. This allows the display control section 103 to discriminate from the content of the arrangement 3104 at what position on the plan view representing the room the device icon 501 is to be disposed.

**[0330]** In the embodiment, the server 300 is not an essential constituent element, and various types of information managed by the server 300 (such as the home information 2700 and the state of the devices 200) may be managed by the home controller 100. This allows the embodiment described above to be embodied without the server 300. In this case, it is not necessary for the home controller 100 to manage information on the entire house, and it is only necessary to manage information related to the devices 200 controlled by the home controller 100 and the house in which the devices 200 are disposed.

#### Industrial Applicability

**[0331]** According to the present disclosure, when a device icon that represents a target device displayed on a floor plan is selected, a control screen for the target device is displayed on the floor plan. Therefore, such a configuration is useful in the case where a portable information terminal is used as a remote controller for a plurality of target devices.

#### Claims

1. A control method for an information apparatus having a display and being connected to a network, one or more target devices being controlled over the network, the control method causing a computer of the information apparatus to:

display a first display screen on the display when display of the first display screen is selected, the first display screen displaying one or more control icons that allow operation or state confirmation of the one or more target devices;  
display a second display screen representing a floor plan of a building on the display when display of the second display screen is selected, and display one or more device icons respectively representing the one or more target devices on the second display screen representing the floor plan, the floor plan represented on the second display screen including one or more rooms, the one or more rooms including information representing an arrangement position at

which each of the one or more target devices is arranged, and the one or more device icons respectively representing the one or more target devices being displayed at a position corresponding to the information representing the arrangement position of each of the one or more target devices included in the floor plan;  
when the second display screen is selected, and when selection of a device icon representing one target device included in the floor plan is sensed in a region corresponding to a room including information representing the arrangement position of the one target device, display a first control screen on the display as overlapped on the second display screen representing the floor plan, the first control screen allowing at least operation or the state confirmation of the target device corresponding to the sensed device icon; and  
output a control command to the network on the basis of an operation on the first control screen, the control command allowing operation or the state confirmation of the target device corresponding to the one target device.

2. The control method according to claim 1, wherein:

when the first display screen is selected, and when selection of the control icon is sensed, a second control screen is displayed on the display, the second control screen allowing operation or the state confirmation the target device corresponding to the sensed control icon; and a control command is output to the network based on an operation on the second control screen, the control command allowing at least operation or the state confirmation of the target device corresponding to the sensed control icon.

3. The control method according to claim 1 or 2, wherein

when the first control screen is displayed as overlapped on the second display screen representing the floor plan, the device icons representing the one or more target devices are moved out of a display region of the first control screen.

4. The control method according to claim 1 or 2, wherein

when the first control screen is displayed as overlapped on the second display screen representing the floor plan, the device icons representing the one or more target devices are moved out of a display region of the second control screen.

5. The control method according to claim 4, wherein when the device icons representing the one or more target devices are moved out of the display region

of the second control screen representing the floor plan, the device icons representing the one or more target devices are arranged in accordance with the one or more rooms that correspond to the one or more target devices and that are included in the floor plan represented by the second display screen.

6. The control method according to claim 4, wherein when the device icons representing the one or more target devices are moved out of the display region of the second control screen representing the floor plan, the device icons representing the one or more target devices are arranged in accordance with model types of the one or more target devices.

7. The control method according to any one of claims 1 to 6, wherein the information representing the arrangement positions of the one or more target devices comprises images representing the one or more target devices.

8. The control method according to any one of claims 1 to 6, wherein the information representing the arrangement positions of the one or more target devices comprises text information representing the one or more target devices.

9. The control method according to any one of claims 1 to 8, wherein the floor plan is a plan view that planarly shows an arrangement and a shape of rooms included in each of the one or more floors of the building.

10. The control method according to any one of claims 1 to 9, wherein the floor plan is a diagram in which blocks representing the one or more rooms in the building are arranged in a matrix for each floor of the building.

11. The control method according to claim 9, wherein the information apparatus includes a device list in which coordinates on the floor plan corresponding to actual arrangement positions of the one or more target devices are registered in advance, and the one or more device icons are arranged at positions indicated by the coordinates in the device list.

12. The control method according to claim 10, wherein the information apparatus includes a device list, information regarding rooms in which the one or more devices are arranged being registered in the device list, and the one or more device icons are arranged within the blocks representing the corresponding rooms, in accordance with the information regarding the rooms registered in the device list.

13. A program to be executed by an information appa-

ratus having a display and being connected to a network, one or more target devices being controlled over the network, the program causing a computer of the information apparatus to:

display a first display screen on the display when display of the first display screen is selected, the first display screen displaying one or more control icon that allow operation or state confirmation of the one or more target devices; display a second display screen representing a floor plan of a building on the display when display of the second display screen is selected, and display one or more device icons respectively representing the one or more target devices on the second display screen representing the floor plan, the floor plan represented on the second display screen including one or more rooms, the one or more rooms including information representing an arrangement position at which each of the one or more target devices is arranged, and the one or more device icons respectively representing the one or more target devices being displayed at a position corresponding to the information representing the arrangement position of each of the one or more target devices included in the floor plan; when the second display screen is selected, and when selection of a device icon representing one target device included in the floor plan is sensed in a region corresponding to a room including information representing the arrangement position of the one target device, display a first control screen on the display as overlapped on the second display screen representing the floor plan, the first control screen allowing at least operation or the state confirmation of the target device corresponding to the sensed device icon; and output a control command to the network on the basis of an operation on the first control screen, the control command allowing operation or the state confirmation of the target device corresponding to the one target device.

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/JP2013/002196

A. CLASSIFICATION OF SUBJECT MATTER H04Q9/00(2006.01)i, G06F13/00(2006.01)i		
According to International Patent Classification (IPC) or to both national classification and IPC		
B. FIELDS SEARCHED		
Minimum documentation searched (classification system followed by classification symbols) H04Q9/00, G06F13/00		
Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched Jitsuyo Shinan Koho 1922-1996 Jitsuyo Shinan Toroku Koho 1996-2013 Kokai Jitsuyo Shinan Koho 1971-2013 Toroku Jitsuyo Shinan Koho 1994-2013		
Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)		
C. DOCUMENTS CONSIDERED TO BE RELEVANT		
Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
A	JP 2003-52093 A (Matsushita Electric Industrial Co., Ltd.), 21 February 2003 (21.02.2003), paragraphs [0060] to [0071]; fig. 1 to 8 & US 2003/0038730 A1 & EP 1416760 A1 & WO 2003/015450 A1 & CN 1539250 A	1-13
A	JP 2007-104567 A (Sharp Corp.), 19 April 2007 (19.04.2007), paragraph [0140]; fig. 25 & US 2007/0080940 A1 & CN 1955898 A	1-13
A	JP 2001-92762 A (Sanyo Electric Co., Ltd.), 06 April 2001 (06.04.2001), paragraphs [0044] to [0046]; fig. 6 (Family: none)	1-13
<input checked="" type="checkbox"/> Further documents are listed in the continuation of Box C. <input type="checkbox"/> See patent family annex.		
* Special categories of cited documents:		
"A"	document defining the general state of the art which is not considered to be of particular relevance	"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
"E"	earlier application or patent but published on or after the international filing date	"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
"L"	document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
"O"	document referring to an oral disclosure, use, exhibition or other means	"&" document member of the same patent family
"P"	document published prior to the international filing date but later than the priority date claimed	
Date of the actual completion of the international search 20 June, 2013 (20.06.13)		Date of mailing of the international search report 02 July, 2013 (02.07.13)
Name and mailing address of the ISA/ Japanese Patent Office		Authorized officer
Facsimile No.		Telephone No.
