Note: Within nine months of the publication of the mention of the grant of the European patent in the European Patent Bulletin, any person may give notice to the European Patent Office of opposition to that patent, in accordance with the Implementing Regulations. Notice of opposition shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

**EP 3 190 167 B1**

**Description****Field of Invention**

5 [0001] The present invention relates to a concentrated solid laundry detergent composition.

**Background of Invention**

10 [0002] WO2014/026856 discloses a water-soluble packaging containing an agent and a water-soluble wrapping. Said water-soluble wrapping contains a bittering agent in a dilution of at least 1:250.

[0003] Bitrex® (Denatonium Benzoate) (CAS 3734-33-6) is the one of the bitterest substances known and is the leading branded safety ingredient used in a variety of domestic and industrial applications.

[0004] Denatonium Benzoate is supplied as a solid or in respective solutions of MEG, MPG ethanol and water.

15 [0005] We have found that the inclusion of Bitrex® in fragrance oils to be sprayed on a large detergent particle results in spray nozzles becoming blocked.

**Summary of the Invention**

20 [0006] We have found that it is possible to include Bitrex® in a near saturated sodium carbonate solution, within 10 wt% of sodium carbonate saturation, and spray the resulting solution on a large particle. The nature of the large particle is such that the spray will adhere to the surface of the particle and the aqueous element substantially evaporated in a fluidized bed to provide a coated large particle.

25 [0007] In one aspect the present invention provides a coated detergent particle with a core, the coated detergent particle having perpendicular dimensions x, y and z, wherein x is from 0.5 to 2 mm, y is from 2 to 8mm, and z is from 2 to 8 mm, the core comprising from 65 to 95 wt% of surfactant and adjuncts and coated with from 5 to 30 wt % of sodium carbonate and from 20 and 1000 ppm of denatonium benzoate, the coating applied as an aqueous solution spray and dried in a fluidized bed. The amounts wt % and ppm amounts described apply to the coated detergent particle as a whole.

30 [0008] The coating applied as an aqueous solution spray and dried in the fluidized bed. The coating is provided by spraying a sodium carbonate solution that is preferably from 80 to 100 percent, preferably 90 percent, of a saturated aqueous solution of sodium carbonate (as measured at 50 °C) and containing between 0.01 to 5 wt% of Bitrex solution. In the sodium carbonate coating per se the level of denatonium benzoate is from 200 to 10000 ppm on a dry basis. All amounts as described herein are on an anhydrous basis.

[0009] The dry basis is the coating formulation after discounting any moisture that may or may not have been removed in process in particular the fluidised bed.

35 [0010] Preferably the particulate detergent composition is and sodium tripoly phosphate (STP) free.

[0011] Unless otherwise stated all wt % refer to the total percentage in the particle as dry weights.

**Detailed Description of the Invention****Large Particle (uncoated)**

40 [0012] The large particle is preferably curved.

[0013] The large particle may be lenticular (shaped like a whole dried lentil), an oblate ellipsoid, where z and y are the equatorial diameters and x is the polar diameter; preferably y = z.

45 [0014] The large particle may be shaped as a disc.

[0015] Preferably the large particle does not have hole; that is to say, the coated laundry detergent particle does not have a conduit passing there through that passes through the core, i.e., the coated detergent particle has a topologic genus of zero.

50 [0016] The large particle has perpendicular dimensions x, y and z, wherein x is from 0.5 to 2 mm, y is from 2 to 8 mm, and z is from 2 to 8 mm. After coating with sodium carbonate and drying in a fluidised bed the coated large particle has approximately the same dimensions as the uncoated large particle. It is more preferred that the large particle contains detergent and other actives.

[0017] The inorganic salt is present on the detergent particle as a coating and the surfactant is present as a core. The inorganic coating reduces agglomeration and deterioration on storage.

55 [0018] The large particle before coating is preferable as described in any one of WO2013/139702; WO/2012/048950; WO/2012/048947; WO/2012/048949 WO/2012/048951; WO/2012/048948; WO/2012/049178; WO/2012/048926; WO/2012/048945; WO2013/149754; WO2013/149755; WO2013/149753; WO2013/149752; and, WO2014/048857.

[0019] Below are examples of preferred large particles that are coated:

## EP 3 190 167 B1

The large particle core is preferably a particulate detergent composition having perpendicular dimensions x, y and z, wherein x is from 0.5 to 2 mm, y is from 2 to 8 mm, and z is from 2 to 8 mm, wherein the particle comprises:

(i) from 20 to 49 wt %, preferably 23 to 45 wt %, more preferably 36 to 42 wt %, of a surfactant selected from: anionic and non-ionic surfactants;

(ii) from 1 to 40 wt %, preferably 2 to 35 wt %, more preferably 3 to 20 wt %, of an active selected from: citric acid and sodium salts thereof;

**[0020]** The large particle is then coated with (v) from 5 to 40 wt %, preferably 5 to 30 wt %, of sodium carbonate and from 20 to 1000 ppm of denatonium benzoate on a dry basis. The large particle core is preferably a particulate detergent composition having perpendicular dimensions x, y and z, wherein x is from 0.5 to 2 mm, y is from 2 to 8 mm, and z is from 2 to 8 mm, wherein the particle comprises:

(i) from 30 to 85 wt % of a surfactant selected from: anionic and non-ionic surfactants.

**[0021]** The large particle is then coated with (v) as described above

**[0022]** To exemplify the process the following is provided for manufacturing detergent particles which comprises the steps of:

a) forming a surfactant blend comprising integer (i);

b) drying the liquid surfactant blend of step (a) in an evaporator or drier to a moisture content of less than 5 wt% and cooling the output from the evaporator or dryer;

c) feeding the cooled material together with integers (ii), (iii), and extruding the cooled material to form an extrudate while periodically cutting the extrudate to form hard detergent particles with a diameter, of greater than 2 mm and a thickness of greater than 0.2 mm, provided that the diameter is greater than the thickness; and,

d) coating the extruded hard detergent particles with up to 40 wt% coating material.

### CORE

### SURFACTANT

**[0023]** In general, the nonionic and anionic surfactants of the surfactant system may be chosen from the surfactants described "Surface Active Agents" Vol. 1, by Schwartz & Perry, Interscience 1949, Vol. 2 by Schwartz, Perry & Berch, Interscience 1958, in the current edition of "McCutcheon's Emulsifiers and Detergents" published by Manufacturing Confectioners Company or in "Tenside-Taschenbuch", H. Stache, 2nd Edn., Carl Hauser Verlag, 1981. Preferably the surfactants used are saturated.

### Anionic Surfactants

**[0024]** Suitable anionic detergent compounds which may be used are usually water-soluble alkali metal salts of organic sulphates and sulphonates having alkyl radicals containing from about 8 to about 22 carbon atoms, the term alkyl being used to include the alkyl portion of higher acyl radicals. Examples of suitable synthetic anionic detergent compounds are sodium and potassium alkyl sulphates, especially those obtained by sulphating higher C<sub>8</sub> to C<sub>18</sub> alcohols, produced for example from tallow or coconut oil, sodium and potassium alkyl C<sub>9</sub> to C<sub>20</sub> benzene sulphonates, particularly sodium linear secondary alkyl C<sub>10</sub> to C<sub>15</sub> benzene sulphonates; and sodium alkyl glyceryl ether sulphates, especially those ethers of the higher alcohols derived from tallow or coconut oil and synthetic alcohols derived from petroleum. Most preferred anionic surfactants are sodium lauryl ether sulfate (SLES), particularly preferred with 1 to 3 ethoxy groups, sodium C<sub>10</sub> to C<sub>15</sub> alkyl benzene sulphonates and sodium C<sub>12</sub> to C<sub>18</sub> alkyl sulphates. Also applicable are surfactants such as those described in EP-A-328 177 (Unilever), which show resistance to salting-out, the alkyl polyglycoside surfactants described in EP-A-070 074, and alkyl monoglycosides. The chains of the surfactants may be branched or linear.

**[0025]** Soaps may also be present. The fatty acid soap used preferably contains from about 16 to about 22 carbon atoms, preferably in a straight chain configuration. The anionic contribution from soap is preferably from 0 to 30 wt % of the total anionic.

**[0026]** Preferably, at least 50 wt % of the anionic surfactant is selected from: sodium C<sub>11</sub> to C<sub>15</sub> alkyl benzene sulphonates; and, sodium C<sub>12</sub> to C<sub>18</sub> alkyl sulphates. Even more preferably, the anionic surfactant is sodium C<sub>11</sub> to C<sub>15</sub> alkyl benzene sulphonates.

#### 5 Nonionic Surfactants

**[0027]** Suitable nonionic detergent compounds which may be used include, in particular, the reaction products of compounds having a hydrophobic group and a reactive hydrogen atom, for example, aliphatic alcohols, acids, amides or alkyl phenols with alkylene oxides, especially ethylene oxide either alone or with propylene oxide. Preferred nonionic detergent compounds are C<sub>6</sub> to C<sub>22</sub> alkyl phenol-ethylene oxide condensates, generally 5 to 25 EO, i.e. 5 to 25 units of ethylene oxide per molecule, and the condensation products of aliphatic C<sub>8</sub> to C<sub>18</sub> primary or secondary linear or branched alcohols with ethylene oxide, generally 5 to 50 EO. Preferably, the non-ionic is 10 to 50 EO, more preferably 20 to 35 EO. Alkyl ethoxylates are particularly preferred.

**[0028]** Cationic surfactant may be present as minor ingredients at levels preferably between 0 to 5 wt % on total surfactant.

**[0029]** Preferably all the surfactants are mixed together before being dried. Conventional mixing equipment may be used. The surfactant core of the laundry detergent particle may be formed by extrusion or roller compaction and subsequently coated with an inorganic salt.

#### 20 Calcium Tolerant Surfactant System

**[0030]** In another aspect the surfactant system used is calcium tolerant and this is a preferred aspect because this reduces the need for builder.

**[0031]** Surfactant blends that do not require builders to be present for effective detergency in hard water are preferred. Such blends are called calcium tolerant surfactant blends if they pass the test set out hereinafter. However, the invention may also be of use for washing with soft water, either naturally occurring or made using a water softener. In this case, calcium tolerance is no longer important and blends other than calcium tolerant ones may be used.

**[0032]** Calcium-tolerance of the surfactant blend is tested as follows:

The surfactant blend in question is prepared at a concentration of 0.7 g surfactant solids per litre of water containing sufficient calcium ions to give a French hardness of 40 (4 x 10<sup>-3</sup> Molar Ca<sup>2+</sup>). Other hardness ion free electrolytes such as sodium chloride, sodium sulphate, and sodium hydroxide are added to the solution to adjust the ionic strength to 0.05M and the pH to 10. The adsorption of light of wavelength 540 nm through 4 mm of sample is measured 15 minutes after sample preparation. Ten measurements are made and an average value is calculated. Samples that give an absorption value of less than 0.08 are deemed to be calcium tolerant.

**[0033]** Examples of surfactant blends that satisfy the above test for calcium tolerance include those having a major part of LAS surfactant (which is not of itself calcium tolerant) blended with one or more other surfactants (co-surfactants) that are calcium tolerant to give a blend that is sufficiently calcium tolerant to be usable with little or no builder and to pass the given test. Suitable calcium tolerant co-surfactants include SLES 1-7EO, and alkyl-ethoxylate nonionic surfactants, particularly those with melting points less than 40°C.

**[0034]** A LAS/SLES surfactant blend has a superior foam profile to a LAS nonionic surfactant blend and is therefore preferred for hand washing formulations requiring high levels of foam. SLES may be used at levels of up to 30 wt % of the surfactant blend.

#### 45 Citric Acid and Sodium Salts Thereof

**[0035]** The particulate detergent composition when dissolved in an aqueous medium is alkaline. In this alkaline solution there are sodium ions present and whilst there may not be any sodium citrate in the particulate detergent composition upon dissolution sodium citrate is generated in solution. It is preferred that sodium citrate is present in the particulate detergent composition.

#### 50 Phosphonate Sequestrant

**[0036]** Phosphonate sequestrants are commercially available. Commercially available Dequest™ phosphonate sequestrants are particularly preferred.

**[0037]** The following are examples of Phosphonate sequestrants: (Dequest® 2010) 1-Hydroxyethylidene -1,1,-diphosphonic acid, (Dequest® 2066) Diethylenetriamine penta(methylene phosphonic acid), (Dequest® 7000) 2-Phosphonobutane - 1,2,4 - tricarboxylic acid, (Dequest® 2066C2) Diethylenetriamine penta(methylene phosphonic acid), Dequest® 2047 ([ethylenebis[nitrilobis(methylene)]] tetrakisphosphonic acid, calcium sodium salt), Dequest® 2016 (1-Hydroxyeth-

ylene-1,1,-diphosphonic acid sodium salt, Na<sub>4</sub>HEDP). Dequest® 2016 and Dequest® 2047 are particularly preferred.

#### Soil Removal Polymer

**[0038]** Soil release polymers improve the main wash performance of the compositions when used in the low in wash surfactant process of the present invention.

**[0039]** One preferred class of polymer is the fabric-substantive polymers comprising at least one of (i) saccharide or (ii) dicarboxylic acid and polyol monomer units. Typically these have soil release properties and while they can have a primary detergency effect they generally assist in subsequent cleaning.

**[0040]** Generally the soil release polymers for polyester will comprise polymers of aromatic dicarboxylic acids and alkylene glycols (including polymers containing polyalkylene glycols).

**[0041]** The polymeric soil release agents useful herein especially include those soil release agents having:

(a) one or more nonionic hydrophilic components consisting essentially of:

(i) polyoxyethylene segments with a degree of polymerization of at least 2, or

(ii) oxypropylene or polyoxypropylene segments with a degree of polymerization of from 2 to 10, wherein said hydrophilic segment does not encompass any oxypropylene unit unless it is bonded to adjacent moieties at each end by ether linkages, or

(iii) a mixture of oxyalkylene units comprising oxyethylene and from 1 to about 30 oxypropylene units wherein said mixture contains a sufficient amount of oxyethylene units such that the hydrophilic component has hydrophilicity great enough to increase the hydrophilicity of conventional polyester synthetic fibre surfaces upon deposit of the soil release agent on such surface, said hydrophilic segments preferably comprising at least about 25% oxyethylene units and more preferably, especially for such components having about 20 to 30 oxypropylene units, at least about 50% oxyethylene units; or

(b) one or more hydrophobic components comprising:

(i) C<sub>3</sub> oxyalkylene terephthalate segments, wherein, if said hydrophobic components also comprise oxyethylene terephthalate, the ratio of oxyethylene terephthalate: C<sub>3</sub> oxyalkylene terephthalate units is about 2:1 or lower,

(ii) C<sub>4</sub>-C<sub>6</sub> alkylene or oxy C<sub>4</sub>-C<sub>6</sub> alkylene segments, or mixtures therein,

(iii) poly (vinyl ester) segments, preferably polyvinyl acetate, having a degree of polymerization of at least 2, or (iv) C<sub>1</sub>-C<sub>4</sub> alkyl ether or C<sub>4</sub> hydroxyalkyl ether substituents, or mixtures therein, wherein said substituents are present in the form of C<sub>1</sub>-C<sub>4</sub> alkyl ether or C<sub>4</sub> hydroxyalkyl ether cellulose derivatives, or mixtures therein, and such cellulose derivatives are amphiphilic, whereby they have a sufficient level of C<sub>1</sub>-C<sub>4</sub> alkyl ether and/or C<sub>4</sub> hydroxyalkyl ether units to deposit upon conventional polyester synthetic fibre surfaces and retain a sufficient level of hydroxyls, once adhered to such conventional synthetic fibre surface, to increase fibre surface hydrophilicity, or a combination of (a) and (b).

**[0042]** Typically, the polyoxyethylene segments of (a)(i) will have a degree of polymerization of from about 200, although higher levels can be used, preferably from 3 to about 150, more preferably from 6 to about 100. Suitable oxy C<sub>4</sub>-C<sub>6</sub> alkylene hydrophobic segments include, but are not limited to, end-caps of polymeric soil release agents such as MO<sub>3</sub>S(CH<sub>2</sub>)<sub>n</sub>OCH<sub>2</sub>CH<sub>2</sub>O<sup>-</sup>, where M is sodium and n is an integer from 4-6, as disclosed in U.S. Pat. No. 4,721,580, issued Jan. 26, 1988 to Gosselink.

**[0043]** Soil release agents characterized by poly(vinyl ester) hydrophobic segments include graft copolymers of poly(vinyl ester), e.g., C<sub>1</sub>-C<sub>6</sub> vinyl esters, preferably poly(vinyl acetate) grafted onto polyalkylene oxide backbones, such as polyethylene oxide backbones. See European Patent Application 0 219 048, published Apr. 22, 1987 by Kud, et al. Commercially available soil release agents of this kind include the SOKALAN type of material, e.g., SOKALAN HP-22, available from BASF (West Germany).

**[0044]** One type of preferred soil release agent is a copolymer having random blocks of ethylene terephthalate and polyethylene oxide (PEO) terephthalate. The molecular weight of this polymeric soil release agent is in the range of from about 25,000 to about 55,000. See U.S. Pat. No. 3,959,230 to Hays, issued May 25, 1976 and U.S. Pat. No. 3,893,929 to Basadur issued Jul. 8, 1975.

**[0045]** Another preferred polymeric soil release agent is a polyester with repeat units of ethylene terephthalate units

contains 10 to 15 wt% of ethylene terephthalate units together with 90 to 80 wt% weight of polyoxyethylene terephthalate units, derived from a polyoxyethylene glycol of average molecular weight 300-5,000. Examples of this polymer include the commercially available material ZELCON 5126 (from DuPont) and MILEASE T (from ICI). See also U.S. Pat. No. 4,702,857, issued Oct. 27, 1987 to Gosselink.

**[0046]** Another preferred polymeric soil release agent is a sulphonated product of a substantially linear ester oligomer comprised of an oligomeric ester backbone of terephthaloyl and oxyalkyleneoxy repeat units and terminal moieties covalently attached to the backbone. These soil release agents are described fully in U.S. Pat. No. 4,968,451, issued Nov. 6, 1990 to J.J. Scheibel and E. P. Gosselink. Other suitable polymeric soil release agents include the terephthalate polyesters of U.S. Pat. No. 4,711,730, issued Dec. 8, 1987 to Gosselink et al, the anionic end-capped oligomeric esters of U.S. Pat. No. 4,721,580, issued Jan. 26, 1988 to Gosselink, and the block polyester oligomeric compounds of U.S. Pat. No. 4,702,857, issued Oct. 27, 1987 to Gosselink.

**[0047]** Preferred polymeric soil release agents also include the soil release agents of U.S. Pat. No. 4,877,896, issued Oct. 31, 1989 to Maldonado et al, which discloses anionic, especially sulfoaroyl, end-capped terephthalate esters.

**[0048]** Still another preferred soil release agent is an oligomer with repeat units of terephthaloyl units, sulfoisoterephthaloyl units, oxyethyleneoxy and oxy-1,2-propylene units. The repeat units form the backbone of the oligomer and are preferably terminated with modified isethionate end-caps. A particularly preferred soil release agent of this type comprises about one sulfoisophthaloyl unit, 5 terephthaloyl units, oxyethyleneoxy and oxy-1,2-propyleneoxy units in a ratio of from about 1.7 to about 1.8, and two end-cap units of sodium 2-(2-hydroxyethoxy)-ethanesulphonate. Said soil release agent also comprises from about 0.5% to about 20%, by weight of the oligomer, of a crystalline-reducing stabilizer, preferably selected from the group consisting of xylene sulfonate, cumene sulfonate, toluene sulfonate, and mixtures thereof.

**[0049]** The most preferred soil release polymers are the water soluble/miscible or dispersible polyesters such as: linear polyesters sold under the Repel-O-Tex brand by Rhodia (Gerol), or the Texcare brand by Clariant, especially Texcare SRN170, and heavily branched polyesters such as those available from Sasol and described in US 7119056. The polyesters are preferably nonionic and comprise a mid block of spaced apart terephthalate repeat units and at least one end block based on polyethylene glycol with a lower alkyl or hydrogen termination.

#### Inorganic salts:

**[0050]** It will be appreciated by those skilled in the art that while multiple layered coatings, of the same or different coating materials, could be applied, a single coating layer is preferred, for simplicity of operation, and to maximise the thickness of the coating. The amount of coating should lay in the range 1 to 40 wt% of the particle, preferably 4 to 30 wt%, more preferably 5 to 25 wt% for the best results in terms of anti-caking properties of the detergent particles.

**[0051]** The coating is preferably applied to the surface of the surfactant core, by deposition from an aqueous solution of the water soluble inorganic salt. In the alternative coating can be performed using a slurry. The aqueous solution preferably contains greater than 50g/L, more preferably 200 g/L of the salt. An aqueous spray-on of the coating solution in a fluidised bed has been found to give good results and may also generate a slight rounding of the detergent particles during the fluidisation process. Drying and/or cooling may be needed to finish the process.

#### The coated laundry detergent particle

**[0052]** Preferably, the coated laundry detergent particle comprises from 10 to 100 wt %, more preferably 50 to 100 wt %, even more preferably 80 to 100 wt %, most preferably 90 to 100 wt % of a laundry detergent formulation in a package.

**[0053]** The package is that of a commercial formulation for sale to the general public and is preferably in the range of 0.01 kg to 5 kg, preferably 0.02 kg to 2 kg, most preferably 0.5 kg to 2 kg.

**[0054]** Preferably, the coated laundry detergent particle is such that at least 90 to 100 % of the coated laundry detergent particles in the in the x, y and z dimensions are within a 20 %, preferably 10%, variable from the largest to the smallest coated laundry detergent particle.

#### Water content

**[0055]** The particle preferably comprises from 0 to 15 wt % water, more preferably 0 to 10 wt %, most preferably from 1 to 5 wt % water, at 293K and 50% relative humidity. This facilitates the storage stability of the particle and its mechanical properties.

#### Other Adjuncts

**[0056]** The adjuncts as described herein may be present in the coating.

Fluorescent Agent

**[0057]** The coated laundry detergent particle preferably comprises a fluorescent agent (optical brightener). Fluorescent agents are well known and many such fluorescent agents are available commercially. Usually, these fluorescent agents are supplied and used in the form of their alkali metal salts, for example, the sodium salts. The total amount of the fluorescent agent or agents used in the composition is generally from 0.005 to 2 wt %, more preferably 0.01 to 0.1 wt %. Suitable Fluorescer for use in the invention are described in chapter 7 of Industrial Dyes edited by K.Hunger 2003 Wiley-VCH ISBN 3-527-30426-6.

**[0058]** Preferred fluorescers are selected from the classes distyrylbiphenyls, triazinylaminostilbenes, bis(1,2,3-triazol-2-yl)stilbenes, bis(benzo[b]furan-2-yl)biphenyls, 1,3-diphenyl-2-pyrazolines and coumarins. The fluorescer is preferably sulfonated.

**[0059]** Preferred classes of fluorescer are: Di-styryl biphenyl compounds, e.g. Tinopal (Trade Mark) CBS-X, Di-amine stilbene di-sulphonic acid compounds, e.g. Tinopal DMS pure Xtra and Blankophor (Trade Mark) HRH, and Pyrazoline compounds, e.g. Blankophor SN. Preferred fluorescers are: sodium 2 (4-styryl-3-sulfophenyl)-2H-naphthol[1,2-d]triazole, disodium 4,4'-bis{[(4-anilino-6-(N methyl-N-2 hydroxyethyl) amino 1,3,5-triazin-2-yl)]amino}stilbene-2-2' disulfonate, disodium 4,4'-bis{[(4-anilino-6-morpholino-1,3,5-triazin-2-yl)]amino} stilbene-2-2' disulfonate, and disodium 4,4'-bis(2-sulfostyryl)biphenyl. Tinopal® DMS is the disodium salt of disodium 4,4'-bis{[(4-anilino-6-morpholino-1,3,5-triazin-2-yl)]amino} stilbene-2-2' disulfonate. Tinopal® CBS is the disodium salt of disodium 4,4'-bis(2-sulfostyryl)biphenyl.

Perfume

**[0060]** Preferably the composition comprises a perfume. The perfume is preferably in the range from 0.001 to 3 wt %, most preferably 0.1 to 1 wt %. Many suitable examples of perfumes are provided in the CTFA (Cosmetic, Toiletry and Fragrance Association) 1992 International Buyers Guide, published by CFTA Publications and OPD 1993 Chemicals Buyers Directory 80th Annual Edition, published by Schnell Publishing Co.

**[0061]** It is commonplace for a plurality of perfume components to be present in a formulation. In the compositions of the present invention it is envisaged that there will be four or more, preferably five or more, more preferably six or more or even seven or more different perfume components.

**[0062]** In perfume mixtures preferably 15 to 25 wt% are top notes. Top notes are defined by Poucher (Journal of the Society of Cosmetic Chemists 6(2):80 [1955]). Preferred top-notes are selected from citrus oils, linalool, linalyl acetate, lavender, dihydromyrcenol, rose oxide and cis-3-hexanol.

Polymers

**[0063]** The composition may comprise one or more further polymers. Examples are carboxymethylcellulose, poly(ethylene glycol), poly(vinyl alcohol), polyethylene imines, ethoxylated polyethylene imines, water soluble polyester polymers polycarboxylates such as polyacrylates, maleic/acrylic acid copolymers and lauryl methacrylate/acrylic acid copolymers.

Enzymes

**[0064]** One or more enzymes are preferred present in a composition of the invention.

**[0065]** Preferably the level of each enzyme is from 0.0001 wt% to 0.5 wt% protein on product.

**[0066]** Especially contemplated enzymes include proteases, alpha-amylases, cellulases, lipases, peroxidases/oxidases, pectate lyases, and mannanases, or mixtures thereof.

**[0067]** Suitable lipases include those of bacterial or fungal origin. Chemically modified or protein engineered mutants are included. Examples of useful lipases include lipases from *Humicola* (synonym *Thermomyces*), e.g. from *H. lanuginosa* (*T. lanuginosus*) as described in EP 258 068 and EP 305 216 or from *H. insolens* as described in WO 96/13580, a *Pseudomonas* lipase, e.g. from *P. alcaligenes* or *P. pseudoalcaligenes* (EP 218 272), *P. cepacia* (EP 331 376), *P. stutzeri* (GB 1,372,034), *P. fluorescens*, *Pseudomonas* sp. strain SD 705 (WO 95/06720 and WO 96/27002), *P. wisconsinensis* (WO 96/12012), a *Bacillus* lipase, e.g. from *B. subtilis* (Dartois et al. (1993), Biochemica et Biophysica Acta, 1131, 253-360), *B. stearothermophilus* (JP 64/744992) or *B. pumilus* (WO 91/16422).

**[0068]** Other examples are lipase variants such as those described in WO 92/05249, WO 94/01541, EP 407 225, EP 260 105, WO 95/35381, WO 96/00292, WO 95/30744, WO 94/25578, WO 95/14783, WO 95/22615, WO 97/04079 and WO 97/07202, WO 00/60063, WO 09/107091 and WO09/111258.

**[0069]** Preferred commercially available lipase enzymes include Lipolase™ and Lipolase Ultra™, Lipex™ (Novozymes A/S) and Lipoclean™.

**[0070]** The method of the invention may be carried out in the presence of phospholipase classified as EC 3.1.1.4

and/or EC 3.1.1.32. As used herein, the term phospholipase is an enzyme which has activity towards phospholipids.

[0071] Phospholipids, such as lecithin or phosphatidylcholine, consist of glycerol esterified with two fatty acids in an outer (sn-1) and the middle (sn-2) positions and esterified with phosphoric acid in the third position; the phosphoric acid, in turn, may be esterified to an amino-alcohol. Phospholipases are enzymes which participate in the hydrolysis of phospholipids. Several types of phospholipase activity can be distinguished, including phospholipases A<sub>1</sub> and A<sub>2</sub> which hydrolyze one fatty acyl group (in the sn-1 and sn-2 position, respectively) to form lysophospholipid; and lysophospholipase (or phospholipase B) which can hydrolyze the remaining fatty acyl group in lysophospholipid. Phospholipase C and phospholipase D (phosphodiesterases) release diacyl glycerol or phosphatidic acid respectively.

[0072] Suitable proteases include those of animal, vegetable or microbial origin. Microbial origin is preferred. Chemically modified or protein engineered mutants are included. The protease may be a serine protease or a metallo protease, preferably an alkaline microbial protease or a trypsin-like protease. Preferred commercially available protease enzymes include Alcalase™, Savinase™, Primase™, Duralase™, Dyrzym™, Esperase™, Everlase™, Polarzyme™, and Kan-nase™, (Novozymes A/S), Maxatase™, Maxacal™, Maxapem™, Properase™, Purafect™, Purafect OxP™, FN2™, and FN3™ (Genencor International Inc.).

[0073] The method of the invention may be carried out in the presence of cutinase, classified in EC 3.1.1.74. The cutinase used according to the invention may be of any origin.

[0074] Preferably cutinases are of microbial origin, in particular of bacterial, of fungal or of yeast origin.

[0075] Suitable amylases (alpha and/or beta) include those of bacterial or fungal origin. Chemically modified or protein engineered mutants are included. Amylases include, for example, alpha-amylases obtained from *Bacillus*, e.g. a special strain of *B. licheniformis*, described in more detail in GB 1,296,839, or the *Bacillus* sp. strains disclosed in WO 95/026397 or WO 00/060060. Commercially available amylases are Duramyl™, Termamyl™, Termamyl Ultra™, Natalase™, Stainzyme™, Fungamyl™ and BAN™ (Novozymes A/S), Rapidase™ and Purastar™ (from Genencor International Inc.).

[0076] Suitable cellulases include those of bacterial or fungal origin. Chemically modified or protein engineered mutants are included. Suitable cellulases include cellulases from the genera *Bacillus*, *Pseudomonas*, *Humicola*, *Fusarium*, *Thielavia*, *Acremonium*, e.g. the fungal cellulases produced from *Humicola insolens*, *Thielavia terrestris*, *Myceliophthora thermophila*, and *Fusarium oxysporum* disclosed in US 4,435,307, US 5,648,263, US 5,691,178, US 5,776,757, WO 89/09259, WO 96/029397, and WO 98/012307. Commercially available cellulases include Celluzyme™, Carezyme™, Endolase™, Renozyme™ (Novozymes A/S), Clazinase™ and Puradax HA™ (Genencor International Inc.), and KAC-500(B)™ (Kao Corporation).

[0077] Suitable peroxidases/oxidases include those of plant, bacterial or fungal origin. Chemically modified or protein engineered mutants are included. Examples of useful peroxidases include peroxidases from *Coprinus*, e.g. from *C. cinereus*, and variants thereof as those described in WO 93/24618, WO 95/10602, and WO 98/15257. Commercially available peroxidases include Guardzyme™ and Novozym™ 51004 (Novozymes A/S).

[0078] Further enzymes suitable for use are disclosed in WO2009/087524, WO2009/090576, WO2009/148983 and WO2008/007318.

[0079] We have found that the composition of the invention serves to boost enzyme cleaning. We have noticed that proteases, e.g., Savinase™, and lipases, e.g., Lipex™, are particularly boosted in efficacy. The boosting of the enzyme efficacy is ascribed to the high citrate, sequester levels.

#### Enzyme Stabilizers

[0080] Any enzyme present in the composition may be stabilized using conventional stabilizing agents, e.g., a polyol such as propylene glycol or glycerol, a sugar or sugar alcohol, lactic acid, boric acid, or a boric acid derivative, e.g., an aromatic borate ester, or a phenyl boronic acid derivative such as 4-formylphenyl boronic acid, and the composition may be formulated as described in e.g. WO 92/19709 and WO 92/19708.

[0081] Where alkyl groups are sufficiently long to form branched or cyclic chains, the alkyl groups encompass branched, cyclic and linear alkyl chains. The alkyl groups are preferably linear or branched, most preferably linear.

[0082] The indefinite article "a" or "an" and its corresponding definite article "the" as used herein means at least one, or one or more, unless specified otherwise. The singular encompasses the plural unless otherwise specified.

[0083] Sequesterant may be present in the coated laundry detergent particles.

#### Experimental

##### Trial I

(comparative test)

[0084] Taking the coated product of the formulation, in table x below, 100, 500 and 1000 PPM Bitrex, of the total

## EP 3 190 167 B1

composition, were added. To ensure the maximum impact of the flavour of the Bitrex it was added to the fragrance oil that is sprayed on as the last processing step.

## Claims

1. A coated detergent particle with a core, the coated detergent particle having perpendicular dimensions x, y and z, wherein x is from 0.5 to 2 mm, y is from 2 to 8mm, and z is from 2 to 8 mm, the core comprising from 65 to 95 wt% of surfactant and adjuncts and coated with from 5 to 30 wt % of sodium carbonate and from 20 and 1000 ppm of

denatonium benzoate, the coating applied as an aqueous solution spray and dried in a fluidized bed.

2. A coated detergent particle according to claim 1, wherein the core is a particulate detergent composition having perpendicular dimensions x, y and z, wherein x is from 0.5 to 2 mm, y is from 2 to 8mm, and z is from 2 to 8 mm, wherein the particle comprises:
  - (i) from 20 to 39 wt %, preferably 23 to 35 wt %, more preferably 26 to 32 wt %, of a surfactant selected from: anionic and non-ionic surfactants;
  - (ii) from 15 to 40 wt %, preferably 20 to 35 wt%, more preferably 25 to 30 wt%, of an active selected from: citric acid and sodium salts thereof;
  - (iii) from 2 to 8 wt %, preferably 3 to 6 wt%, of a phosphonate sequestrant; and, (iv) from 0 to 3 wt %, preferably 1 to 2.5 wt%, of a soil removal polymer.
3. A coated detergent particle according to claim 1, wherein the core is a particulate detergent composition having perpendicular dimensions x, y and z, wherein x is from 0.5 to 2 mm, y is from 2 to 8mm, and z is from 2 to 8 mm, wherein the particle comprises from 20 to 39 wt % of a surfactant selected from: anionic and non-ionic surfactants.
4. A coated detergent particle according to claim 1 or 2, wherein the total level of denatonium benzoate in the coated detergent particle is in the range from 20 to 1000 ppm of which from 80 to 100 wt% is in the sodium carbonate coating.
5. A coated detergent particle according to claim 1 or 2, wherein the inorganic salt comprises sodium carbonate in the range from 10 to 100% sodium carbonate.
6. A coated detergent particle according to any one of the preceding claims, wherein the particle comprises from 0 to 15 wt % water.
7. A coated detergent particle composition according to claim 6, wherein the particle comprises from 1 to 5 wt % water.
8. A coated detergent particle according to any one of the preceding claims, wherein the coating is applied as a sodium carbonate solution that is from 80 to 100 percent of a saturated aqueous solution of sodium carbonate, as measured at 50 °C, and containing between 0.01 to 5 wt% of Denatonium Benzoate in solution.

## Patentansprüche

1. Beschichtetes Reinigungsmittelpartikel mit einem Kern, wobei das beschichtete Reinigungsmittelpartikel senkrechte Dimensionen x, y und z aufweist, wobei x von 0,5 bis 2 mm beträgt, y von 2 bis 8 mm beträgt und z von 2 bis 8 mm beträgt, wobei der Kern von 65 bis 95 Gew.-% Tensid und Zusätze umfasst und mit von 5 bis 30 Gew.-% Natriumcarbonat und von 20 bis 1000 ppm Denatoniumbenzoat beschichtet ist, wobei die Beschichtung als wässriger Lösungsspray aufgetragen und in einem Fließbett getrocknet wird.
2. Beschichtetes Reinigungsmittelpartikel nach Anspruch 1, wobei der Kern eine teilchenförmige Reinigungsmittelzusammensetzung mit senkrechten Dimensionen x, y und z ist, wobei x von 0,5 bis 2 mm, y von 2 bis 8 mm und z von 2 bis 8 mm beträgt, wobei das Partikel umfasst:
  - (i) von 20 bis 39 Gew.-%, vorzugsweise von 23 bis 35 Gew.-%, bevorzugter von 26 bis 32 Gew.-%, eines aus anionischen und nicht-ionischen Tensiden ausgewählten Tensids,
  - (ii) von 15 bis 40 Gew.-%, vorzugsweise von 20 bis 35 Gew.-%, bevorzugter von 25 bis 30 Gew.-% eines aus Citronensäure und Natriumsalzen davon ausgewählten aktiven Mittels,
  - (iii) von 2 bis 8 Gew.-%, vorzugsweise von 3 bis 6 Gew.-%, eines Phosphonatkomplexbildners und
  - (iv) von 0 bis 3 Gew.-%, vorzugsweise von 1 bis 2,5 Gew.-% eines Schmutzentfernungspolymers.
3. Beschichtetes Reinigungsmittelpartikel nach Anspruch 1, wobei der Kern eine teilchenförmige Reinigungsmittelzusammensetzung mit senkrechten Dimensionen x, y und z ist, wobei x von 0,5 bis 2 mm, y von 2 bis 8 mm und z von 2 bis 8 mm beträgt, wobei das Partikel 20 bis 39 Gew.-% eines aus anionischen und nicht-ionischen Tensiden ausgewählten Tensids umfasst.
4. Beschichtetes Reinigungsmittelpartikel nach Anspruch 1 oder 2, wobei die Gesamtkonzentration des Denatonium-

benzoats in dem beschichteten Reinigungsmittelpartikel in dem Bereich von 20 bis 1000 ppm liegt, wovon 80 bis 100 Gew.-% in der Natriumcarbonatbeschichtung vorliegen.

- 5 5. Beschichtetes Reinigungsmittelpartikel nach Anspruch 1 oder 2, wobei das anorganische Salz Natriumcarbonat in dem Bereich von 10 bis 100% Natriumcarbonat umfasst.
6. Beschichtetes Reinigungsmittelpartikel nach irgendeinem der vorhergehenden Ansprüche, wobei das Partikel von 0 bis 15 Gew.-% Wasser umfasst.
- 10 7. Beschichtete Reinigungsmittelpartikelzusammensetzung nach Anspruch 6, wobei das Partikel von 1 bis 5 Gew.-% Wasser umfasst.
8. Beschichtetes Reinigungsmittelpartikel nach irgendeinem der vorhergehenden Ansprüche, wobei die Beschichtung als eine Natriumcarbonatlösung aufgetragen wird, die zu 80 bis 100 Prozent eine gesättigte wässrige Lösung von Natriumcarbonat ist, gemessen bei 50°C, und enthaltend zwischen 0,01 bis 5 Gew.-% Denatoniumbenzoat in Lösung.

## Revendications

- 20 1. Particule de détergent revêtue avec un noyau, la particule de détergent revêtue ayant des dimensions perpendiculaires x, y et z, où x est de 0,5 à 2 mm, y est de 2 à 8 mm, et z est de 2 à 8 mm, le noyau comprenant de 65 à 95 % en masse de tensioactif et d'auxiliaires et revêtu avec de 5 à 30 % en masse de carbonate de sodium et de 20 à 1 000 ppm de benzoate de denatonium, le revêtement appliqué comme une pulvérisation de solution aqueuse et séché dans un lit fluidisé.
- 25 2. Particule de détergent revêtue selon la revendication 1, où le noyau est une composition de détergent particulière ayant des dimensions perpendiculaires x, y et z, où x est de 0,5 à 2 mm, y est de 2 à 8 mm, et z est de 2 à 8 mm, où la particule comprend :
  - 30 (i) de 20 à 39 % en masse, de préférence de 23 à 35 % en masse, encore mieux de 26 à 32 % en masse, d'un tensioactif choisi parmi : des tensioactifs anioniques et non-ioniques ;
  - (ii) de 15 à 40 % en masse, de préférence de 20 à 35 % en masse, encore mieux de 25 à 30 % en masse, d'un actif choisi parmi : l'acide citrique et des sels de sodium de celui-ci ;
  - (iii) de 2 à 8 % en masse, de préférence de 3 à 6 % en masse, d'un séquestrant de phosphonate ; et,
  - 35 (iv) de 0 à 3 % en masse, de préférence de 1 à 2,5 % en masse, d'un polymère éliminant la saleté.
3. Particule de détergent revêtue selon la revendication 1, où le noyau est une composition de détergent particulière ayant des dimensions perpendiculaires x, y et z, où x est de 0,5 à 2 mm, y est de 2 à 8 mm, et z est de 2 à 8 mm, où la particule comprend de 20 à 39 % en masse d'un tensioactif choisi parmi : des tensioactifs anioniques et non-ioniques.
4. Particule de détergent revêtue selon la revendication 1 ou 2, où la teneur totale en benzoate de denatonium dans la particule de détergent revêtue se trouve dans l'intervalle de 20 à 1 000 ppm dont de 80 à 100 % en masse se trouvent dans le revêtement de carbonate de sodium.
- 45 5. Particule de détergent revêtue selon la revendication 1 ou 2, où le sel inorganique comprend du carbonate de sodium dans l'intervalle de 10 à 100 % de carbonate de sodium.
6. Particule de détergent revêtue selon l'une quelconque des revendications précédentes, où la particule comprend de 0 à 15 % en masse d'eau.
- 50 7. Composition de particule de détergent revêtue selon la revendication 6, où la particule comprend de 1 à 5 % en masse d'eau.
- 55 8. Particule de détergent revêtue selon l'une quelconque des revendications précédentes, où le revêtement est appliqué comme une solution de carbonate de sodium qui est de 80 à 100 pourcents d'une solution aqueuse saturée de carbonate de sodium, comme mesuré à 50°C, et contenant de 0,01 à 5 % en masse de benzoate de denatonium en solution.
