(54) **MODIFIED PEPTIDES AND THEIR USE FOR TREATING AUTOIMMUNE DISEASES**

(57) The present invention relates to a peptide, or a salt thereof, comprising or consisting of the amino acid sequence
IH-MVYSKRSGKPRGYAFIEY, comprising one or more post-translational modifications.

EP 3 202 413 A1

Description**FIELD OF THE INVENTION**

[0001] The present invention relates to a modified peptide, and its use for treating autoimmune diseases.

INCORPORATION BY REFERENCE

[0002] A Sequence Listing containing SEQ ID NOs: 1-6 is filed herewith, and is hereby incorporated by reference in its entirety.

BACKGROUND

[0003] Autoimmune diseases arise from an overactive immune response of the immune system against substances and tissues normally present in a multicellular organism, i.e. the immune system attacks its own components. This may be restricted to certain organs or involve a particular tissue in different places. The treatment of autoimmune diseases is typically with immunosuppression - medication which decreases the whole immune response.

[0004] Lupus is an autoimmune disease that is estimated to affect nearly 1,4 million Americans, primarily women between the ages of 20-40. Lupus involves antibodies that attack connective tissue. The principal form of lupus is a systemic one (systemic lupus erythematosus; SLE). SLE is a chronic autoimmune disease with strong genetic as well as environmental components (See, e.g., Hochberg M C, Dubois' Lupus Erythematosus. 5th ed., Wallace D J, Hahn B H, eds. Baltimore: Williams and Wilkins (1997); Wakeland E K, et al., Immunity 2001; 15(3):397-408; Nath S K, et al., Curr. Opin. Immunol. 2004; 16(6):794-800; D'Cruz et al., Lancet (2007), 369:587-596). Various additional forms of lupus are known, including, but not limited to, cutaneous lupus erythematosus (CLE), lupus nephritis (LN), neuropsychiatric lupus (NPLE) and neonatal lupus.

[0005] Untreated lupus can be fatal as it progresses from attack of skin and joints to internal organs, including lung, heart, and kidneys (with renal disease being the primary concern), thus making early and accurate diagnosis of and/or assessment of risk of developing lupus particularly critical. Lupus mainly appears as a series of flare-ups, with intervening periods of little or no disease manifestation. Kidney damage, measured by the amount of protein in the urine (proteinuria), is one of the most acute areas of damage associated with pathogenicity in SLE, and accounts for at least 50% of the mortality and morbidity of the disease, without any treatment.

[0006] Clinically, SLE is a heterogeneous disorder characterized by high-affinity autoantibodies (autoAbs). AutoAbs play an important role in the pathogenesis of SLE, and the diverse clinical manifestations of the disease are due to the deposition of antibody-containing immune complexes in blood vessels leading to inflammation in the kidney, brain and skin. AutoAbs also have direct pathogenic effects contributing to hemolytic anemia and thrombocytopenia. SLE is associated with the production of antinuclear antibodies, circulating immune complexes, and defect of the complement system. SLE has an incidence of about 1 in 700 women between the ages of 20 and 60, in black population. SLE can affect any organ system and can cause severe tissue damage. Numerous autoAbs of differing specificity are present in SLE. SLE patients often produce autoAbs having anti-DNA, anti-Ro, and antiplatelet specificity and that are capable of initiating clinical features of the disease, such as glomerulonephritis, arthritis, serositis, complete heart block in newborns, and hematologic abnormalities. These autoAbs are also possibly related to central nervous system disturbances. Arbuckle et al. described the development of autoAbs before the clinical onset of SLE (Arbuckle et al. N. Engl. J. Med. 349(16): 1526-1533 (2003)).

[0007] AutoAbs recognizing RNA-binding proteins (RBPs; also referred to as extractable nuclear antigens) were first characterized in SLE over 40 years ago (Holman, Ann N Y Acad. Sci. 124(2):800-6 (1965)). Such RBPs comprise a group of proteins-SSA (Ro52/TRIM21 and Ro60/TROVE2), SSB (La), U1 small nuclear ribonucleoprotein (RNP) protein and Smith (Sm) protein -with roles in RNA processing and biochemistry. Anti-SSA-and anti-SSB IgG autoAbs are found not only in SLE, but also Sjögren's and rheumatoid arthritis syndrome. Anti-SSA autoAbs are associated with subacute cutaneous lupus erythematosus, and with congenital heart block and neonatal lupus in children of anti-SSA positive women. Anti-SSB autoAbs are nearly always found together with anti-SSA autoAbs, and both autoantigens associate with cytoplasmic hYRNA (Lerner et al., Science 211(4480):400-2 (1981)). Anti-Sm autoAbs are highly specific for SLE and are generally found together with anti-RNP autoAbs. Both Sm and RNP proteins associate with specific snRNA species in the nuclear RNA spliceosome (Lerner et al., Proc Natl Acad Sci USA 76(11):5495-9 (1979)). Anti-RNP autoAbs are also found in patients with mixed connective tissue disease. It has been suggested that the presence of anti-RBP autoAbs may identify SLE cases that show less durable responses following B cell depletion therapy (Cambridge et al., Ann Rheum Dis 67:1011-16 (2008)).

[0008] Prior art discloses medicines for the treatment of autoimmune diseases. For instance, both international applications WO 03/020747 and WO 03/025014 disclose a fragment of snRNP 70 kDa, which is modified by phosphorylation

and/or by acetylation, for treating such pathologies, i.e. autoimmune disease. However, further experimentation has indicated that the peptides disclosed in WO 03/020747 and WO 03/025014 are relatively unstable and rapidly eliminated when administered to mammals. Moreover, some of the disclosed peptides are inactive.

[0009] Therefore, there is a need to provide a better treatment for auto-immune pathologies.

SUMMARY

[0010] The present description provides compositions and methods of using the same that are based on the surprising and unexpected discovery that certain modified forms of the peptide of SEQ ID NO:2 are more stable when administered to mammals. Thus, in one aspect the present description provides compositions comprising the same and a pharmaceutically acceptable carrier.

[0011] In another aspect, the present description provides a pharmaceutical composition, or drug, useful for amelioration of auto-immune diseases, advantageously for the treatment of lupus.

[0012] In an additional aspect, the present description provides methods for treating an auto-immune disease comprising administering an effective amount of a therapeutic composition as described herein.

[0013] In certain embodiments; the description provides an isolated peptide (recombinant or synthesized), or a salt thereof, comprising or consisting of the amino acid sequence:

IHMVYSKRSGKPRGYAFIEY [SEQ ID NO: 2],

in which the Serine (S) at position 9 is phosphorylated, and the Methionine (M) at position 3 is oxidized.

[0014] In certain embodiments, the description provides a peptide of compound I having the following formula:

[0015] Compound I can also be represented by:

IHM(O)VYSKRS(PO₃H₂)GKPRGYAFIEY [SEQ ID NO: 5]

in which "M(O)" represents oxidized methionine, and "S(PO₃H₂)" represents phosphoserine.

[0016] These peptides are derived from the human U1 snRNP 70 kDa protein (SEQ ID NO: 3), and correspond to the region delimited by the amino acid segment extending from the residue 132 to the residue 151 of SEQ ID NO: 3. Formally, the residue which is phosphorylated corresponds to the amino acid at the position 140 from the first methionine of SEQ ID NO: 3, and the residue which is oxidized corresponds to the amino acid at the position 134 from the first methionine of SEQ ID NO: 3.

[0017] In certain aspects, the description provides an isolated peptide comprising or consisting of the amino acid sequence of SEQ ID NO: 1, or salt thereof, having at least one post-translational modification selected from the group consisting of phosphorylation of a serine residue, oxidation of a methionine residue, and acetylation of a lysine residue, and combinations thereof. In an embodiment of this aspect, the description provides a composition comprising an isolated peptide having or consisting of the amino acid sequence of SEQ ID NO: 1, or salt thereof, wherein the peptide comprises a phosphoserine at position 10, and an oxidized Methionine residue at position 4. In certain additional embodiments, the peptide of SEQ ID NO:1 also comprises an acetylated lysine residue. In particular, said peptide of SEQ ID NO: 1 comprises a phosphoserine at position 10, and an oxidized Methionine residue at position 4, and an acetylation of one or both of the lysine at position 8 and 12, and more particularly further comprises a phosphoserine at position 7.

[0018] In additional aspects, the description provides an isolated peptide comprising or consisting of the amino acid sequence of SEQ ID NO: 2, or salt thereof, having at least one post-translational modification selected from the group consisting of phosphorylation of a serine residue, oxidation of a methionine residue, and acetylation of a lysine residue, and combinations thereof. In an embodiment of this aspect, the description provides a composition comprising an isolated peptide having or consisting of the amino acid sequence of SEQ ID NO: 2, or salt thereof, wherein the peptide comprises a phosphoserine at position 9, and an oxidized Methionine residue at position 3. In certain additional embodiments, the peptide of SEQ ID NO:2 also comprises an acetylated lysine residue.

[0020] In certain embodiments, the description provides a peptide of compound II having the following formula:

[0020] In certain embodiments, the description provides a peptide of compound II having the following formula:

[0021] Compound II can also be represented by:

RIHM(O)VYSKRS(PO₃H₂)GKPRGYAFIEY [SEQ ID NO: 4]

in which M(O) represents oxidation of methionine, and S(PO₃H₂) represents the phosphorylation of serine.

[0022] Thus, the description provides peptides, or a salt thereof, comprising or consisting of the amino acid sequence chosen among the group consisting of SEQ ID NO: 4 and SEQ ID NO: 5.

[0023] The Invention will be better illustrated by the following figures 1 to 6, the accompanying description, examples, and the appended claims, all of which illustrate various exemplary embodiment(s) of the invention and are not to be construed as limiting the invention.

BRIEF DESCRIPTION OF THE DRAWINGS

[0024] The accompanying drawings, which are incorporated into and form a part of the specification, illustrate several embodiments of the present invention and, together with the description, serve to explain the principles of the invention. The drawings are only for the purpose of illustrating an embodiment of the invention and are not to be construed as limiting the invention.

Figure 1 represents the stability at 37°C of the peptide according to the invention (Compound II) compared to the stability of the peptide consisting of SEQ ID NO: 1, in which serine at position 10 is phosphorylated. The graph represents the percentage of stability over the time (expressed in days). Curves A-C represent the stability of Compound II at a concentration of 200, 100 and 50 µg/ml, respectively. Curves D-F represent the stability of the peptide consisting of SEQ ID NO: 1, in which serine at position 10 is phosphorylated at a concentration of 200, 100 and 50 µg/ml, respectively.

Figure 2 is a Kaplan-Meier graph representing the cumulative survival rate (in percent) over the time (expressed in weeks) of mice injected with NaCl (line with circles), the peptide consisting of SEQ ID NO: 1, in which serine at position 10 is phosphorylated (line with squares) and compound II according to the invention (lines with triangles).

Figure 3 represents the proteinuria score over the time (expressed in weeks) of mice injected with NaCl (line with circles), the peptide consisting of SEQ ID NO: 1, in which serine at position 10 is phosphorylated (line with squares) and compound II according to the invention (lines with triangles).

Figure 4 represents the measure of the hypercellularity of MRL/lpr mice cells. Y-axis represents the number of cells/mL of blood ($\times 10^6$), in mice treated with NaCl (circles), the peptide consisting of SEQ ID NO: 1, in which serine at position 10 is phosphorylated (squares) and compound II according to the invention (triangles).

Figure 5 represents the measure of the affinity for the HSC70 protein of the peptide consisting of SEQ ID NO: 1, in which serine at position 10 is phosphorylated. Curves corresponds to the Biacore response over the time (expressed in seconds) by using the peptide consisting of SEQ ID NO: 1, in which serine at position 10 is phosphorylated at a concentration of 25 μ M(A), 12.5 μ M(B), 6.25 μ M(C), 3.12 μ M(D) and 1.56 μ M (E).

Figure 6 represents the measure of the affinity of the compound II according to the invention, for the HSC70 protein. Curves correspond to the Biacore response over the time (expressed in seconds) by using the compound II at a concentration of 25 μ M(A), 12.5 μ M(B), 6.25 μ M(C), 3.12 μ M(D) and 1.56 μ M (E).

DETAILED DESCRIPTION

[0025] The following is a detailed description of the invention provided to aid those skilled in the art in practicing the present invention. Those of ordinary skill in the art may make modifications and variations in the embodiments described herein without departing from the spirit or scope of the present invention. Although any methods and materials similar or equivalent to those described herein can also be used in the practice or testing of the present invention, the preferred methods and materials are now described. Unless otherwise defined, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art to which this invention belongs. The terminology used in the description of the invention herein is for describing particular embodiments only and is not intended to be limiting of the invention. All publications, patent applications, patents, figures and other references mentioned herein are expressly incorporated by reference in their entirety.

[0026] As used herein, the following terms may have meanings ascribed to them below, unless specified otherwise. However, it should be understood that other meanings that are known or understood by those having ordinary skill in the art are also possible, and within the scope of the present invention.

[0027] Where a range of values is provided, it is understood that each intervening value, to the tenth of the unit of the lower limit unless the context clearly dictates otherwise, between the upper and lower limit of that range and any other stated or intervening value in that stated range is encompassed within the invention. The upper and lower limits of these smaller ranges which may independently be included in the smaller ranges is also encompassed within the invention, subject to any specifically excluded limit in the stated range. Where the stated range includes one or both of the limits, ranges excluding either both of those included limits are also included in the invention.

[0028] It must be noted that as used herein and in the appended claims, the singular forms "a", "and", and "the" include plural references (i.e., refer to one or to more than one or at least one) to the grammatical object of the article. By way of example, "an element" means one element or more than one element.

[0029] The term "about" as it is used herein, in association with numeric values or ranges, reflects the fact that there is a certain level of variation that is recognized and tolerated in the art due to practical and/or theoretical limitations. For example, minor variation is tolerated due to inherent variances in the manner in which certain devices operate and/or measurements are taken. In accordance with the above, the phrase "about " is normally used to encompass values within the standard deviation or standard error.

[0030] As used herein, "derivatives" are compositions formed from the native compounds either directly, by modification, or by partial substitution. As used herein, "analogs" are compositions that have a structure similar to, but not identical to, the native compound.

[0031] The term "effective amount/dose," "pharmaceutically effective amount/dose," "pharmaceutically effective amount/dose" or "therapeutically effective amount/dose" can mean, but is in no way limited to, that amount/dose of the active pharmaceutical ingredient sufficient to prevent, inhibit the occurrence, ameliorate, delay or treat (alleviate a symptom to some extent, preferably all) the symptoms of a condition, disorder or disease state. The effective amount depends on the type of disease, the composition used, the route of administration, the type of mammal being treated, the physical characteristics of the specific mammal under consideration, concurrent medication, and other factors which those skilled in the medical arts will recognize. Generally, an amount between 0.1 mg/kg and 1000 mg/kg body weight/day of active ingredients is administered dependent upon potency of the agent. Toxicity and therapeutic efficacy of such compounds can be determined by standard pharmaceutical procedures in cell cultures or experimental animals, e.g., for determining the LD₅₀ (the dose lethal to 50% of the population) and the ED₅₀ (the dose therapeutically effective in 50% of the population). The dose ratio between toxic and therapeutic effects is the therapeutic index and it can be expressed as the ratio LD₅₀/ED₅₀. Compounds that exhibit large therapeutic indices are preferred. While compounds that exhibit toxic side effects may be used, care should be taken to design a delivery system that targets such compounds to the site of affected tissue in order to minimize potential damage to uninfected cells and, thereby, reduce side effects. The data obtained from the cell culture assays and animal studies can be used in formulating a range of dosage for use in humans. The dosage of such compounds lies preferably within a range of circulating concentrations that include the ED₅₀ with little or no toxicity. The dosage may vary within this range depending upon the dosage form employed and the route of administration utilized. For any compound used in the method of the invention, the therapeutically effective dose can be estimated initially from cell culture assays. A dose may be formulated in animal models to achieve a circulating plasma concentration range that includes the IC₅₀ (i.e., the concentration of the test compound which achieves a half-maximal inhibition of symptoms) as determined in cell culture. Such information can be used to more accurately determine useful doses in humans. Levels in plasma may be measured, for example, by high performance liquid chromatography.

[0032] The term "pharmacological composition," "therapeutic composition," "therapeutic formulation" or "pharmaceutically acceptable formulation" can mean, but is in no way limited to, a composition or formulation that allows for the effective distribution of an agent provided by the invention, which is in a form suitable for administration to the physical location most suitable for their desired activity, e.g., systemic administration.

[0033] The term "pharmaceutically acceptable" or "pharmacologically acceptable" can mean, but is in no way limited to, entities and compositions that do not produce an adverse, allergic or other untoward reaction when administered to an animal, or a human, as appropriate.

[0034] The term "pharmaceutically acceptable carrier" or "pharmacologically acceptable carrier" can mean, but is in no way limited to, any and all solvents, dispersion media, coatings, antibacterial and antifungal agents, isotonic and absorption delaying agents, and the like, compatible with pharmaceutical administration. Suitable carriers are described in the most recent edition of Remington's Pharmaceutical Sciences, a standard reference text in the field, which is incorporated herein by reference. Preferred examples of such carriers or diluents include, but are not limited to, water, saline, finger's solutions, dextrose solution, and 5% human serum albumin. Liposomes and non-aqueous vehicles such as fixed oils may also be used. The use of such media and agents for pharmaceutically active substances is well known in the art. Except insofar as any conventional media or agent is incompatible with the active compound, use thereof in the compositions is contemplated. Supplementary active compounds can also be incorporated into the compositions.

[0035] The term "systemic administration" refers to a route of administration that is, e.g., enteral or parenteral, and results in the systemic distribution of an agent leading to systemic absorption or accumulation of drugs in the blood stream followed by distribution throughout the entire body. Suitable forms, in part, depend upon the use or the route of entry, for example oral, transdermal, or by injection. Such forms should not prevent the composition or formulation from reaching a target cell (i.e., a cell to which the negatively charged polymer is desired to be delivered to). For example, pharmacological compositions injected into the blood stream should be soluble. Other factors are known in the art, and include considerations such as toxicity and forms which prevent the composition or formulation from exerting its effect. Administration routes which lead to systemic absorption include, without limitations: intravenous, subcutaneous, intraperitoneal, inhalation, oral, intrapulmonary and intramuscular. The rate of entry of a drug into the circulation has been shown to be a function of molecular weight or size. The use of a liposome or other drug carrier comprising the compounds of the instant invention can potentially localize the drug, for example, in certain tissue types, such as the tissues of the reticular endothelial system (RES). A liposome formulation which can facilitate the association of drug with the surface of cells, such as, lymphocytes and macrophages is also useful.

[0036] The term "local administration" refers to a route of administration in which the agent is delivered to a site that is apposite or proximal, e.g., within about 10 cm, to the site of the lesion or disease.

[0037] The term "derivatives" can mean, but is in no way limited to, chemical compositions, for example, nucleic acids, nucleotides, polypeptides or amino acids, formed from the native compounds either directly, by modification, or by partial substitution. The term "analogs" can mean, but is in no way limited to, chemical compositions, for example, nucleic acids, nucleotides, polypeptides or amino acids that have a structure similar to, but not identical to, the native compound.

[0038] The term "conservative mutations" refers to the substitution, deletion or addition of nucleic acids that alter, add or delete a single amino acid or a small number of amino acids in a coding sequence where the nucleic acid alterations result in the substitution of a chemically similar amino acid. Amino acids that may serve as conservative substitutions for each other include the following: Basic: Arginine (R), Lysine (K), Histidine (H); Acidic: Aspartic acid (D), Glutamic acid (E), Asparagine (N), Glutamine (Q); hydrophilic: Glycine (G), Alanine (A), Valine (V), Leucine (L), Isoleucine (I); Hydrophobic: Phenylalanine (F), Tyrosine (Y), Tryptophan (W); Sulfur-containing: Methionine (M), Cysteine (C). In addition, sequences that differ by conservative variations are generally homologous.

[0039] By "homology" is meant the nucleotide sequence of two or more nucleic acid molecules or two or more nucleic acid or amino acid sequences is partially or completely identical. In certain embodiments the homologous nucleic acid or amino acid sequence has 30%, 40%, 50%, 60%, 70%, 80%, 90%, or 95% sequence similarity or identity to a nucleic acid encoding the amino acid sequence of SEQ ID NO:1 or SEQ ID NO:1, respectively.

[0040] "Homologs" can be naturally occurring, or created by artificial synthesis of one or more nucleic acids having related sequences, or by modification of one or more nucleic acid to produce related nucleic acids. Nucleic acids are homologous when they are derived, naturally or artificially, from a common ancestor sequence (e.g., orthologs or paralog). If the homology between two nucleic acids is not expressly described, homology can be inferred by a nucleic acid comparison between two or more sequences. If the sequences demonstrate some degree of sequence similarity, for example, greater than about 30% at the primary amino acid structure level, it is concluded that they share a common ancestor. For purposes of the present invention, genes are homologous if the nucleic acid sequences are sufficiently similar to allow recombination and/or hybridization under low stringency conditions. In addition, polypeptides are regarded as homologous if their nucleic acid sequences are sufficiently similar to allow recombination or hybridization under low stringency conditions, and optionally they demonstrate membrane repair activity, and optionally they can be recognized by (i.e., cross-react with) an antibody specific for an epitope contained within the amino acid sequence of at least one of SEQ ID NOs: 1-6.

[0041] The term "cell" can mean, but is in no way limited to, its usual biological sense, and does not refer to an entire multicellular organism. The cell can, for example, be *in vivo*, *in vitro* or *ex vivo*, e.g., in cell culture, or present in a multicellular organism, including, e.g., birds, plants and mammals such as humans, cows, sheep, apes, monkeys, swine, dogs, and cats. The cell can be prokaryotic (e.g., bacterial cell) or eukaryotic (e.g., mammalian or plant cell).

[0042] The term "host cell" can mean, but is in no way limited to, a cell that might be used to carry a heterologous nucleic acid, or expresses a peptide or protein encoded by a heterologous nucleic acid. A host cell can contain genes that are not found within the native (non-recombinant) form of the cell, genes found in the native form of the cell where the genes are modified and re-introduced into the cell by artificial means, or a nucleic acid endogenous to the cell that has been artificially modified without removing the nucleic acid from the cell. A host cell may be eukaryotic or prokaryotic. General growth conditions necessary for the culture of bacteria can be found in texts such as *BERGEY'S MANUAL OF SYSTEMATIC BACTERIOLOGY*, Vol. 1, N. R. Krieg, ed., Williams and Wilkins, Baltimore/London (1984). A "host cell" can also be one in which the endogenous genes or promoters or both have been modified to produce one or more of the polypeptide components of the complex of the invention.

[0043] As used herein, "P140" refers to a peptide consisting of the amino acid sequence SEQ ID NO: 1, in which serine at position 10 is phosphorylated.

[0044] The term "therapeutically effective amount or dose" includes a dose of a drug that is capable of achieving a therapeutic effect in a subject in need thereof. For example, a therapeutically effective amount of a drug can be the amount that is capable of preventing or relieving one or more symptoms associated with a disease or disorder, e.g., tissue injury or muscle-related disease or disorder. The exact amount can be ascertainable by one skilled in the art using known techniques (see, e.g., Lieberman, *Pharmaceutical Dosage Forms* (vols. 1-3, 1992); Lloyd, *The Art, Science and Technology of Pharmaceutical Compounding* (1999); Pickar, *Dosage Calculations* (1999); and Remington: *The Science and Practice of Pharmacy*, 20th Edition, 2003, Gennaro, Ed., Lippincott, Williams & Wilkins).

[0045] A kit is any manufacture (e.g. a package or container) comprising at least one reagent, e.g. a probe, for specifically detecting a marker of the invention. The manufacture may be promoted, distributed, or sold as a unit for performing the methods of the present invention. The reagents included in such a kit comprise probes/primers and/or antibodies for use in detecting sensitivity and resistance gene expression. In addition, the kits of the present invention may preferably contain instructions which describe a suitable detection assay. Such kits can be conveniently used, e.g., in clinical settings, to diagnose patients exhibiting symptoms of cancer, in particular patients exhibiting the possible presence of a tumor.

[0046] Unless otherwise defined, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art to which this invention belongs. All publications, patent applications, patents, and other references mentioned herein are incorporated by reference in their entirety. In the case of conflict, the present specification, including definitions, will control. In addition, the materials, methods, and examples are illustrative only and not intended to be limiting.

[0047] The following references, the entire disclosures of which are incorporated herein by reference, provide one of skill with a general definition of many of the terms used in this invention: Singleton et al., *Dictionary of Microbiology and Molecular Biology* (2nd ed. 1994); *The Cambridge Dictionary of Science and Technology* (Walker ed., 1988); *The Glossary of Genetics*, 5th Ed., R. Rieger et al. (eds.), Springer Verlag (1991); and Hale & Marham, the Harper Collins *Dictionary of Biology* (1991).

[0048] The present description provides compositions and methods of using the same that are based on the surprising and unexpected discovery that certain modified forms of the peptide of SEQ ID NO:2 are stable when administered to mammals. Thus, in one aspect the present description provides compositions comprising the same and a pharmaceutically acceptable carrier.

[0049] In another aspect, the present description provides a pharmaceutical composition, or drug, useful for amelioration of auto-immune diseases, advantageously for the treatment of lupus.

[0050] In an additional aspect, the present description provides methods for treating an auto-immune disease comprising administering an effective amount of a therapeutic composition as described herein.

[0051] In certain embodiments, the description provides an isolated peptide (recombinant or synthesized), or a salt thereof, comprising or consisting of the amino acid sequence:

IHMVYSKRSGKPRGYAFIEY [SEQ ID NO: 2],

in which the Serine (S) at position 9 is phosphorylated, and the Methionine (M) at position 3 is oxidized.

[0052] In certain embodiments, the description provides a peptide of compound I having the following formula:

[0053] Compound I can also be represented by:

IHM(O)VYSKRS(PO₃H₂)GKPRGYAFIEY [SEQ ID NO: 5]

in which "M(O)" represents oxidized methionine, and "S(PO₃H₂)" represents phosphoserine.

[0054] These peptides are derived from the human U1 snRNP 70 kDa protein (SEQ ID NO: 3), and correspond to the region delimited by the amino acid segment extending from the residue 132 to the residue 151 of SEQ ID NO: 3. Formally, the residue which is phosphorylated corresponds to the amino acid at the position 140 from the first methionine of SEQ ID NO: 3, and the residue which is oxidized corresponds to the amino acid at the position 134 from the first methionine of SEQ ID NO: 3.

[0055] In certain aspects, the description provides an isolated peptide comprising or consisting of the amino acid sequence of SEQ ID NO: 1, or salt thereof, having at least one post-translational modification selected from the group consisting of phosphorylation of a serine residue, oxidation of a methionine residue, and acetylation of a lysine residue, and combinations thereof. In an embodiment of this aspect, the description provides a composition comprising an isolated peptide having or consisting of the amino acid sequence of SEQ ID NO: 1, or salt thereof, wherein the peptide comprises a phosphoserine at position 10, and an oxidized Methionine residue at position 4. In certain additional embodiments, the peptide of SEQ ID NO:1 also comprises an acetylated lysine residue.

[0056] In additional aspects, the description provides an isolated peptide comprising or consisting of the amino acid sequence of SEQ ID NO: 2, or salt thereof, having at least one post-translational modification selected from the group consisting of phosphorylation of a serine residue, oxidation of a methionine residue, and acetylation of a lysine residue, and combinations thereof. In an embodiment of this aspect, the description provides a composition comprising an isolated peptide having or consisting of the amino acid sequence of SEQ ID NO: 2, or salt thereof, wherein the peptide comprises a phosphoserine at position 9, and an oxidized Methionine residue at position 3. In certain additional embodiments, the peptide of SEQ ID NO:2 also comprises an acetylated lysine residue.

[0057] In certain aspects, the description provides a composition comprising an effective amount of one or more of the peptides as described herein. In certain embodiments, the composition further comprises a pharmaceutically acceptable carrier. In an additional embodiment, the description provides a composition comprising an effective amount of at least one peptide, or salt thereof, selected from the group consisting of the amino acid sequence SEQ ID NO: 2, comprising a phosphoserine at position 9, and oxidized Methionine at position 3; the amino acid sequence SEQ ID NO: 1, comprising a phosphoserine at position 10, and an oxidized Methionine at position 4; and a combination of both.

[0058] In certain embodiments, the description provides a peptide of compound II having the following formula:

[0059] Compound II can also be represented by:

RIHM(O)VYSKRS(PO₃H₂)GKPRGYAFIEY [SEQ ID NO: 4]

in which M(O) represents the oxidation, and S(PO₃H₂) represents the phosphorylation.

[0060] The description provides peptides, and/or salts thereof, comprising or consisting of the amino acid sequence chosen among the group consisting of SEQ ID NO: 4, SEQ ID NO: 5, and combinations thereof, as well as compositions comprising the same.

[0061] In certain embodiments, the description provides an isolated peptide having the amino acid sequence of SEQ ID NO: 1, comprising a phosphoserine at position 10, and an oxidized methionine at position 4 (e.g., SEQ ID NO: 4) (herein, also referred to as Compound II or P140(MO)).

[0062] According to the present description, the isolated peptides having the amino acid sequence of SEQ ID NO: 4 or 5, respectively, are modified by at least two post-translational modifications (modifications that occur after the synthesis of the peptides). In certain embodiments, the post-translational modification is selected from the group consisting of phosphorylation (addition of a phosphate PO_3H_2), e.g., phosphorylation of a serine residue; oxidation, e.g., oxidation of a methionine residue; acetylation, e.g., acetylation of a lysine residue; and combinations thereof.

[0063] In a preferred embodiment, the description provides an isolated peptide having the amino acid sequence as set forth in SEQ ID NO: 2 comprising a phosphoserine at position 9 and an oxidized methionine at position 3, or salt thereof. In certain embodiments, the description provides the peptide having the amino acid sequence as set forth in SEQ ID NO: 2, comprising a phosphoserine at position 9 and an oxidized methionine at position 3, or salt thereof, and a carrier, e.g., a pharmaceutically acceptable carrier. In certain additional embodiments, the description provides a composition, e.g., a therapeutic composition, comprising an effective amount of a peptide having the amino acid sequence as set forth in SEQ ID NO: 2, comprising a phosphoserine at position 9 and an oxidized methionine at position 3, or salt thereof, and a carrier, e.g., a pharmaceutically acceptable carrier.

[0064] In another embodiment, the description provides an isolated peptide having the amino acid sequence as set forth in SEQ ID NO: 4 comprising a phosphoserine at position 10, and an oxidized methionine at position 4, or salt thereof. In certain embodiments, the description provides the peptide having the amino acid sequence as set forth in SEQ ID NO: 4 comprising a phosphoserine at position 10, and an oxidized methionine at position 4, or salt thereof, and a carrier, e.g., a pharmaceutically acceptable carrier. In certain additional embodiments, the description provides a composition, e.g., a therapeutic composition, comprising an effective amount of a peptide having the amino acid sequence as set forth in SEQ ID NO: 4 comprising a phosphoserine at position 10, or salt thereof, and an oxidized methionine at position 4, and a carrier, e.g., a pharmaceutically acceptable carrier.

[0065] In another embodiment, the description provides an isolated peptide having the amino acid sequence as set forth in SEQ ID NO: 5 comprising a phosphoserine at position 9 and an oxidized methionine at position 3, or salt thereof. In certain embodiments, the description provides the peptide having the amino acid sequence as set forth in SEQ ID NO: 5 comprising a phosphoserine at position 9 and an oxidized methionine at position 3, or salt thereof, and a carrier, e.g., a pharmaceutically acceptable carrier. In certain additional embodiments, the description provides a composition, e.g., a therapeutic composition, comprising an effective amount of a peptide having the amino acid sequence as set forth in SEQ ID NO: 5 comprising a phosphoserine at position 9 and an oxidized methionine at position 3, or salt thereof, and a carrier, e.g., a pharmaceutically acceptable carrier.

[0066] Surprisingly and unexpectedly, it was discovered that the peptides as described herein are more stable *in vitro* compared to the non-oxidized counterpart. The stability is measured as disclosed in the example section. The phosphorylated-oxidized peptide is less spontaneously degraded in solution compared to the non-oxidized counterpart, said stability enhancing its biological properties.

[0067] In addition, the inventors have surprisingly identified that the methionine oxidation enhances the peptide stability, without affecting the biological effect of such peptide, contrary to the teaching of the prior art. Indeed, it is largely reported in the art that proteins or peptides containing oxidized methionine have disruptions in their three-dimensional structure and/or bioactivity. The modified peptides as described herein have an affinity for HSC70 protein essentially identical to the non-oxidized counterpart as disclosed in the example section.

[0068] In certain embodiments, the oxidation occurs in the Methionine (M) at position 9 of SEQ ID NO: 2, or at position 10 of SEQ ID NO: 1, which are the equivalent positions to the position 134 of SEQ ID NO: 3. The sulfur atom is oxidized as illustrated below.

methionine oxidized methionine (methionine sulfoxide)

[0069] The above peptides (SEQ ID NO: 1, 2, 4 and 5) can be synthesized by techniques commonly used in the art, such as biological synthesis or chemical synthesis. Biological synthesis refers to the production, *in vivo*, *in vitro* or *ex vivo*, of the peptide of interest, by the transcription and translation of a nucleic acid molecule coding for said peptides.

[0070] For instance the nucleic acid sequence:

MGNATHCAYATGGTNTAYWSNAARMGNWSNGGNAARCCNMGNGG

NTAYGCNTTYATHGARTAYTRR [SEQ ID NO: 6]

is transcribed and translated either in an *in vitro* system, or in a host organism, in order to produce the peptide SEQ ID NO: 1. The produced peptide is thus purified according to well known techniques.

[0071] Chemical synthesis consists to polymerize the desired peptide by adding the required amino acids. A method is disclosed in the example section.

[0072] It is possible to chemically synthesize the peptides SEQ ID NO: 1 and 2 by classical Fmoc (N-[9-fluorenyl]methoxycarbonyl) solid-phase chemistry and purified by reversed-phase high-performance liquid chromatography (HPLC; Neimark and Briand, 1993; Monneaux et al., 2003, Eur. J. Immunol. 33,287-296; Page et al., 2009, PloS ONE 4,e5273).

[0073] It is also possible to directly synthesize the peptides SEQ ID NO: 1 and 2, in which respective residues at position 10 and 9 are phosphorylated. For this purpose, during the peptide synthesis a Fmoc-Ser(PO(Obz)OH)-OH-type serine derivative was used, at the desired position.

[0074] Phosphate group (-PO₃H₂) can also be added after the synthesis of the peptide, according to protocols well known in the art.

[0075] Serine can be phosphorylated by incubating the peptides SEQ ID NO : 1 or 2 with specific serine kinase chosen among Protein Kinase A or C (PKA or PKC) or casein kinase II, in presence of adenosine triphosphate (ATP). The peptides are thus phosphorylated in one serine (at position 6 or 9 of SEQ ID NO: 2, or at position 7 or 10 of SEQ ID NO: 1), or both serine. The desired phosphorylated peptide is separated from the others for instance by chromatography.

[0076] A chemical addition of -PO₃H₂ can also be added at the specific position (at position 9 of SEQ ID NO: 2, or at position 10 of SEQ ID NO: 1), by using specific protective group, that the skilled person can easily choose according to his common knowledge.

[0077] Any other techniques known in the art, allowing the specific phosphorylation of serine, can be used.

[0078] In certain embodiments, the oxidation of Methionine is performed according to the following process:

treating with either with H₂O₂, 20mM, at 37°C for 4 hours, or
in a solution of dimethylsulfoxide (DMSO; Me₂SO), 0.1M plus HCl 0.5 M, at 22°C for 30 to 180 min.

[0079] Any other techniques known in the art, allowing the specific oxidation of methionine, can be used.

[0080] In any of the aspects or embodiments described herein, the peptide(s) provided by the description can be present in a form of a salt known to a person skilled in the art, such as, e.g., sodium salts, ammonium salts, calcium salts, magnesium salts, potassium salts, acetate salts, carbonate salts, citrate salts, chloride salts, sulphate salts, amino chlorhydrate salts, borhydrate salts, benzensulphonate salts, phosphate salts, dihydrogenophosphate salts, succinate salts, citrate salts, tartrate salts, lactate salts, mandelate salts, methane sulfonate salts (mesylate) or p-toluene sulfonate salts (tosylate). This list is provided by way of example and is not meant to be limiting on the present invention. For example, the skilled person can easily determine, according to his knowledge, the appropriate salt.

[0081] In an additional embodiment, the description provides a peptide comprising or consisting of the amino acid sequence:

RIHMOVSKRSGKPRGYAFIEY [SEQ ID NO: 1],

comprising a phosphoserine at position 10, and an oxidized Methionine at position 4, or salt thereof. In one advantageous embodiment, the invention relates to the peptide as defined above, consisting of the amino acid sequence SEQ ID NO: 4, or salt thereof.

[0082] In another aspect, the description provides a therapeutic composition comprising at least a peptide as described herein, or salt thereof, and a drug having an immunosuppressive effect. In certain embodiments, the therapeutic composition comprises an effective amount of a peptide as described herein, and an effective amount of a drug having an immunosuppressive effect. In one embodiment, the peptide has the amino acid sequence SEQ ID NO: 1, comprising a phosphoserine at position 10, and a drug having an immunosuppressive effect.

[0083] The peptide consisting of the amino acid sequence SEQ ID NO : 1, in which the Serine at position 10 is phosphorylated corresponds to the below Compound III:

15

20

25

3

34

4

4

5

5

water for injection, saline solution, fixed oils, polyethylene glycols, glycerine, propylene glycol or other synthetic solvents; antibacterial agents such as benzyl alcohol; antioxidants such as ascorbic acid or sodium bisulfate; chelating agents such as ethylenediamine-tetraacetic acid; buffers such as acetates, citrates or phosphates and agents for the adjustment of tonicity such as sodium chloride or dextrose. pH can be adjusted with acids or bases, such as hydrochloric acid or sodium hydroxide. The parenteral preparation can be enclosed in ampules, disposable syringes or multiple dose vials made of glass or plastic.

[0094] Pharmaceutical compositions suitable for injectable use include sterile aqueous solutions (where water soluble) or dispersions and sterile powders for the extemporaneous preparation of sterile injectable solutions or dispersions. For intravenous administration, suitable carriers include physiological saline, bacteriostatic water, Cremophor EL (BASF; Parsippany, N.J.) or phosphate buffered saline (PBS). In all cases, the composition must be sterile and should be fluid to the extent that easy syringability exists. It must be stable under the conditions of manufacture and storage and must be preserved against the contaminating action of microorganisms such as bacteria and fungi. The carrier can be a solvent or dispersion medium containing, for example, water, ethanol, polyol (for example, glycerol, propylene glycol, and liquid polyethylene glycol, and the like), and suitable mixtures thereof. The proper fluidity can be maintained, for example, by the use of a coating such as lecithin, by the maintenance of the required particle size in the case of dispersion and by the use of surfactants. Prevention of the action of microorganisms can be achieved by various antibacterial and antifungal agents, for example, chlorobutanol, phenol, ascorbic acid, and the like. In many cases, it will be preferable to include isotonic agents, for example, sugars, polyalcohols such as mannitol, sorbitol, or sodium chloride in the composition. Prolonged absorption of the injectable compositions can be brought about by including in the composition an agent which delays absorption, for example, aluminum monostearate and gelatin.

[0095] Sterile injectable solutions can be prepared by incorporating the active compound (e.g., a polypeptide or antibody) in the required amount in an appropriate solvent with one or a combination of ingredients enumerated above, as required, followed by filtered sterilization. Generally, dispersions are prepared by incorporating the active compound into a sterile vehicle which contains a basic dispersion medium, and then incorporating the required other ingredients from those enumerated above. In the case of sterile powders for the preparation of sterile injectable solutions, the preferred methods of preparation are vacuum drying and freeze-drying which yields a powder of the active ingredient plus any additional desired ingredient from a previously sterile-filtered solution thereof.

[0096] Oral compositions generally include an inert diluent or an edible carrier. They can be enclosed in gelatin capsules or compressed into tablets. For the purpose of oral therapeutic administration, the active compound can be incorporated with excipients and used in the form of tablets, troches, or capsules. Oral compositions can also be prepared using a fluid carrier for use as a mouthwash, wherein the compound in the fluid carrier is applied orally and swished and expectorated or swallowed.

[0097] For administration by inhalation, the compounds are delivered in the form of an aerosol spray from a pressurized container or dispenser which contains a suitable propellant, e.g., a gas such as carbon dioxide, or a nebulizer.

[0098] Systemic administration can also be by transmucosal or transdermal means. For transmucosal or transdermal administration, penetrants appropriate to the barrier to be permeated are used in the formulation. Such penetrants are generally known in the art, and include, for example, for transmucosal administration, detergents, bile salts, and fusidic acid derivatives. Transmucosal administration can be accomplished through the use of nasal sprays or suppositories. For transdermal administration, the active compounds are formulated into ointments, salves, gels, or creams as generally known in the art.

[0099] The compounds can also be prepared in the form of suppositories (e.g., with conventional suppository bases such as cocoa butter and other glycerides) or retention enemas for rectal delivery.

[0100] In one embodiment, the active compounds are prepared with carriers that will protect the compound against rapid elimination from the body, such as a controlled release formulation, including implants and microencapsulated delivery systems. Biodegradable, biocompatible polymers can be used, such as ethylene vinyl acetate, polyanhydrides, polyglycolic acid, collagen, polyorthoesters, and polylactic acid. Methods for preparation of such formulations will be apparent to those skilled in the art. The materials can also be obtained commercially from Alza Corporation and Nova Pharmaceuticals, Inc. Liposomal suspensions (including liposomes having monoclonal antibodies incorporated therein or thereon) can also be used as pharmaceutically acceptable carriers. These can be prepared according to methods known to those skilled in the art, for example, as described in U.S. Pat. No. 4,522,811.

[0101] It is especially advantageous to formulate oral or parenteral compositions in dosage unit form for ease of administration and uniformity of dosage. Dosage unit form as used herein refers to physically discrete units suited as unitary dosages for the subject to be treated; each unit containing a predetermined quantity of active compound calculated to produce the desired therapeutic effect in association with the required pharmaceutical carrier. The specification for the dosage unit forms of the invention are dictated by and directly dependent on the unique characteristics of the active compound and the particular therapeutic effect to be achieved, and the limitations inherent in the art of compounding such an active compound for the treatment of individuals.

[0102] In certain embodiments of the methods provided herein, the method includes the step of administering a dosage

from about 100 ng to about 5 mg of a therapeutic or pharmaceutical composition as described herein. In certain embodiments, e.g., in human, the pharmaceutical composition as described herein may contain mannitol as carrier, and the composition is administered from 10 µg to 500 µg, preferably 200 µg, in a single administration.

[0103] In certain additional aspects, the dosage regimen can be reproduced from 1 to 3 times / week, every week to every four week. for as long as needed with therapeutic windows and thus for several years. In a preferred embodiment, the dosage regimen is 12 weeks of treatment but can be repeated twice a year for several years. An example of administration is: one injection of 200 µg of peptide, every 4 weeks, for 12 weeks (i.e. 3 injections separated from each other by 4 weeks).

[0104] The treatment can be prolonged by administration every 6 months.

[0105] Preferred pharmaceutically acceptable carriers can comprise, for example, xanthan gum, locust bean gum, galactose, other saccharides, oligosaccharides and/or polysaccharides, starch, starch fragments, dextrans, British gum and mixtures thereof. Advantageously, the pharmaceutically acceptable carrier is of natural origin. The pharmaceutically acceptable carrier can be, or can further comprise, an inert saccharide diluent selected from a monosaccharide or disaccharide. Advantageous saccharide is mannitol.

[0106] Advantageously, the invention relates to a pharmaceutical composition as defined above, which is in the form of a lozenge, tablet, gelatin, capsule, drop, pill, liposome, or nano particles, or in the form of a solution. An advantageous solution is a solution comprising from 5 to 15 %, in particular about 10% of mannitol. The solution should be isoosmolar.

[0107] The invention also relates to a drug comprising a combination product as defined above, for a simultaneous, separate or sequential use.

EXAMPLES

Statistics

[0108] Statistical tests were performed using GraphPad Prism version 5.0. The two-way ANOVA test was used to analyze statistical significance of proteinuria differences between control and peptide-treated groups of mice. Survival of control and P140 analogue-treated female MRL/lpr mice was analyzed by the Kaplan-Meier method, and the significance of differences was determined by the log-rank test. For the other variables, statistical significance was assessed using the Student's *t*-test. *p* values less than 0.05 were considered significant.

Example 1: Chemical synthesis of the peptides.

[0109] P140 peptide and P140(MO) were synthesized using classical Fmoc (N-[9-fluorenyl] methoxycarbonyl) solid-phase chemistry and purified by reversed-phase high-performance liquid chromatography (HPLC; Neimark and Briand, 1993; Monneaux et al., 2003, Eur. J. Immunol. 33,287-296; Page et al., 2009, PloS ONE 4,e5273). Their homogeneity was checked by analytical HPLC, and their identity was assessed by LC/MS on a Finnigan LCQ Advantage Max system (Thermo Fischer Scientific). After completion of the reaction, the peptides were purified by HPLC.

[0110] In order to introduce the phosphorylation at the serine residue equivalent to the residue 140 of SEQ ID NO: 3, an Fmoc-Ser(PO(Obz)OH)-OH-type serine derivative was used. The coupling time is increased to 30 minutes and a second coupling is carried out systematically. After cleavage in acid medium, each peptide is precipitated by cold ether, solubilized in a solution of water and acetonitrile and finally lyophilized. The peptides are then purified by RP-HPLC, their integrity and their purity has been analyzed by analytic HPLC and by mass spectrometry (Maldi-TOF).

[0111] Oxidation is introduced as mentioned above.

Example 2: Stability of the peptides.

[0112] The stability of the peptide SEQ ID NO : 2 in which the serine at position 10 is phosphorylated and the methionine at position 4 is oxydized (P140(MO)), and the peptide SEQ ID NO : 1 in which the serine at position 10 is phosphorylated (P140) was measured at 37°C, in a solution of 10% (v/v) mannitol. For each peptide, 3 concentrations have been tested: 200, 100 and 50 µg/mL.

[0113] At the indicated time, the integrity of P140 and P140(MO) peptides was measured in saline by high-performance liquid chromatography from the area of the peak corresponding to the intact peptide.

[0114] Results are shown in figure 1.

[0115] The following tables 1 and 2 summarize the results:

Table 1

Stability (%)	Days	P140(MO)			P140		
		200 µg/mL	100 µg/mL	50 µg/mL	200 µg/mL	100 µg/mL	50 µg/mL
	0	100	100	100	100	100	100
	20	100	99.1	100	98.7	97.5	95.5
	40	100	99.5	100	98.5	96.2	93.2
	60	-	-	-	97.9	95.5	91.5
	80	-	-	-	97.6	94.5	90.3
	100	100	99.1	99.4	97.4	93.4	89.6

Table 2

Stability (%)	Days	P140(MO)			P140		
		200 µg/mL	100 µg/mL	50 µg/mL	200 µg/mL	100 µg/mL	50 µg/mL
	Linear equation	$y = 100$	$y = -0,0064x + 100,11$	$y = -0,0064x + 99,677$	$y = -0,0238x + 99,535$	$y = -0,0612x + 99,25$	$y = -0,099x + 98,299$
	Correlation coefficient	N/A	$R^2 = 0,8571$	$R^2 = 0,4157$	$R^2 = 0,8854$	$R^2 = 0,9538$	$R^2 = 0,9065$
	95% of stability (predicted)	∞	2 years + 2 months	2 years	6 months	2 months	1 months

[0116] Stability is measured by using the HPLC peak surface.

[0117] P140 M(O) stability remains unchanged (100%, 99.1% and 99.4%) over 100 days at 37°C, for each of the tested concentrations (50 to 200 µg/ml).

[0118] P140 stability decreases over the time and is reduced after 100 days at 37°C (97.4%, 93.4% et 89.6%) for each of the tested concentrations (50 to 200 µg/ml).

[0119] These data demonstrate that the oxidation of the methionine in the peptide P140 enhance the stability of the peptide. P140(MO) is stable at all the tested concentration over 100 days.

Example 2: Therapeutic effect of the peptides in MRL/lpr mice.

[0120] MRL/lpr mouse strain is a mouse substrain that is genetically predisposed to the development of systemic lupus erythematosus-like syndrome, which has been found to be clinically similar to the human disease. It has been determined that this mouse strain carries a mutation in the fas gene. Also, the MRL/lpr is a useful model to study behavioural and cognitive deficits found in autoimmune diseases and the efficacy of immunosuppressive agents [Monneaux et al., 2003, Eur. J. Immunol. 33,287-296].

2.1- Survival analysis

[0121] Five-week-old female MRL/lpr mice received P140 or peptide P140(MO) intravenously as described (Monneaux et al., 2003, Eur. J. Immunol. 33,287-296). All experimental protocols were carried out with the approval of the local Institutional Animal Care and Use Committee (CREMEAS). As control, mice were injected with NaCl.

[0122] Twenty mice were used for each peptide or NaCl.

[0123] The results are shown in figure 2.

[0124] A Log-rank (Mantel-Cox) Test has been applied and the results are the following: NaCl vs P140 $p=0.0686$,

NaCl vs P140(MO) $p=0.0026$, P140 vs P140 M(O) $p=0.2366$.

[0125] The Median survival of mice is :NaCl = 25 weeks, P140 = 29 weeks and P140 (MO) > 40 weeks. These results demonstrate the efficacy of the P140(MO) peptide *in vivo* in the treatment of lupus, in mice.

2.2- Proteinuria analysis

[0126] Proteinuria of the above mice was measured in fresh urine using Albustix (Bayer Diagnostics) and was semi-quantitatively estimated according to a 0-4 scale recommended by the manufacturer (no proteinuria=0; traces=1; 1+=2; 2+=3; 3+=4; 4+=5).

[0127] The results are shown in figure 3.

[0128] In this figure, it is observed that the proteinuria is less important and appears lately in P140 M(O)-treated mice compared to the untreated mice.

2.3- Cellularity analysis

[0129] MRL/lpr mice were injected with 100 μ g/100 μ L of P140 or P140(MO) and cellularity (preipheral blood) was studied 5 days after this unique injection. The count includes all the leucocytes. In view of the low number of tested mice, a non parametric statistical test has been realised Mann-Whitney).

The results are shown in figure 4.

[0130] Thus, in an acute murine model of lupus, peptide of SEQ ID NO: 4 was able to decrease peripheral hypercellularity and delays biological and clinical signs of the disease with an efficacy at least similar to that of P140, or better.

Example 3: Affinity of the peptides for HSC70 protein.

[0131] BIAcore 3000 system (Biacore AB) was used to evaluate the binding of P140 peptides to HSC70 protein (Page et al., 2009, and 2011). Sensor chip CM5, surfactant P20, amine coupling kit containing N-hydroxysuccinimide (NHS) and N-ethyl-N'-dimethylaminopropyl carbodiimide (EDC), 2-(2-pyridinyldithio)ethaneamine (PDEA) and ethanolamine were from Biacore AB. Biosensor assays were performed with HBS-EP buffer as running buffer (10 mM HEPES, 150 mM NaCl, 3 mM EDTA, 0.005% surfactant P20, pH 7.4). The compounds were diluted in the running buffer. The sensor chip surface was regenerated after each experiment by injecting 10 μ L of 10 mM HCl. Recombinant bovine HSC70 (Stressgen) was immobilized on flow cells of a CM5 sensor chip through its thiol groups using 35 μ L PDEA in 50 mM borate buffer, pH 8.3 on the NHS/EDC-activated matrix. Then, 35 μ L of HSC70 (100 μ g/mL in formate buffer, pH 4.3) were injected until a response of 13,000 response units (RU) corresponding to 13 ng/mm² of HSC70 was immobilized. Twenty μ L of a 50 mM cysteine/1 M NaCl solution was used to saturate unoccupied sites on the chip. The direct binding measurement of P140 peptides to HSC70 was carried out at 25°C with a constant flow rate of 20 μ L/min. P140 peptide and analogues were injected in the flux at different concentrations for 3 min, followed by a dissociation phase of 3 min. The kinetic parameters were calculated using the BIAeval 3.1 software on a personal computer. Analysis was performed using the simple 1:1 Langmuir binding model. The specific binding profiles were obtained after subtracting the response signal from the control empty channel and from blank-buffer injection. The fitting to each model was judged by the χ^2 value and randomness of residue distribution compared to the theoretical model.

[0132] Results are shown in the tables 3 and 4, and in figures 5 and 6

[0133] These tables demonstrate that the affinity for HSC70 is not statistically different between P140 and P140 M(O) peptides.

[0134] Thus, these two peptides bind with the same efficiency HSC70.

Table 3: P140 on HSC70

Claims

1. A peptide, or salt thereof, comprising or consisting of an amino acid sequence with at least 90% homology with the amino acid sequence of SEQ ID NO : 1

45

RIHMYYSKRSKPRGYAFIEY [SEQ ID NO: 1],

comprising a phosphoserine at position 10, and an oxidized methionine at position 4.

50

2. The peptide of claim 1, wherein the peptide has at least 95% homology with the amino acid sequence of SEQ ID NO: 1, comprising a phosphoserine at position 10, and an oxidized methionine at position 4.

3. The peptide of claim 1, wherein the peptide further comprises an acetylated lysine and/or a phosphoserine at position 7.

55

4. A composition comprising a peptide according to claim 1, 2 or 3 or a combination thereof, and a drug having an immunosuppressive or an immunomodulatory effect.

5. A pharmaceutical composition comprising a peptide according to claims 1 to 3, the composition of claim 4 or a

combination thereof, further comprising a pharmaceutically acceptable carrier.

- 5
6. The pharmaceutical composition according to claim 5, which is in the form of a lozenge, tablet, gelatin, capsule, drop, pill, liposome, nanoparticles or in the form of a solution.
7. A pharmaceutical composition according to claim 5 or 6 for use in the treatment of an autoimmune disease.
8. The pharmaceutical composition for use according to claim 7, wherein said autoimmune disease is selected from the group consisting of autoimmune pathologies of the family of connective tissue diseases (non-specific systemic organ diseases), preferably systemic lupus erythematosus (SLE), rheumatoid arthritis, mixed connective tissue disease, Sjögren's syndrome, and chronic juvenile arthritis; and organ-specific autoimmune pathologies, preferably multiple sclerosis, insulin-dependent diabetes, Crohn's disease, and bullous diseases.
- 10
9. The pharmaceutical composition for use according to claim 7 or 8, wherein said autoimmune disease is SLE.
- 15
10. A kit having a container comprising the peptide of any of claims 1 to 3 or the composition of any of claims 4 to 6.
- 20
- 25
- 30
- 35
- 40
- 45

**ANNEX TO THE EUROPEAN SEARCH REPORT
ON EUROPEAN PATENT APPLICATION NO.**

EP 16 19 5776

5 This annex lists the patent family members relating to the patent documents cited in the above-mentioned European search report.
The members are as contained in the European Patent Office EDP file on
The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
