Note: Within nine months of the publication of the mention of the grant of the European patent in the European Patent Bulletin, any person may give notice to the European Patent Office of opposition to that patent, in accordance with the Implementing Regulations. Notice of opposition shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

## Description

### TECHNICAL FIELD

[0001] The present invention relates to a cleaner.

### BACKGROUND ART

[0002] Cleaners may be classified into a manual cleaner that a user moves in person for cleaning and an automatic cleaner that automatically moves for cleaning.

[0003] Manual cleaners may fall into, depending on the types, a canister cleaner, an upright cleaner, a handy cleaner, and a stick cleaner.

[0004] EP 2 811 885 A1 relates to a vacuum cleaner according to the preamble of claim 1 and comprising a main body and a separating apparatus associated with the main body, wherein the main body includes a suction generator for drawing air into the separating apparatus and a handle arrangement including a trigger member for activating the suction generator.

[0005] US 2012/222251 A1 relates to a surface cleaning apparatus comprising an air flow path extending from a dirty air inlet to a clean air outlet. The surface cleaning apparatus may also comprise a main body comprising a suction motor provided in the air flow path. A cyclone bin assembly may be provided in the air flow path and may be removably mounted to the main body. The cyclone bin assembly may comprise a cyclone chamber. A hose connector may be provided on the main body. The hose connector may comprise a portion of the air flow path from the dirty air inlet to the cyclone bin assembly. The hose connector may be nested in the cyclone bin assembly when the cyclone bin assembly is mounted to the main body.

[0006] Meanwhile, in the related art, a handheld vacuum cleaner has been disclosed in Korean Patent No. 10-1127088 (registered on 8 March, 2012).

[0007] The handheld vacuum cleaner includes a suction pipe, an airflow generator, a cyclone, a power supply, and a handle.

[0008] A PCB connected to a suction motor and a battery may be disposed in the handle.

[0009] According to the document, however, the airflow generator is disposed over the handle and the power supply is disposed under the handle, so the internal space of the handle is small. Therefore, the structure for installing the PCB is complicated and it is difficult to install the PCB.

### TECHNICAL PROBLEM

[0010] It is an object of the present invention to provide a cleaner in which a main PCB can be easily installed in a handle.

[0011] It is a further object of the present invention to provide a cleaner in which a main PCB can be fixed to a handle when it is inserted into the handle without using

a specific fastener for fixing the main PCB to the handle.

[0012] It is a further object of the present invention to provide a cleaner in which the size of a handle can be reduced by decreasing the size of a main PCB. These objects are achieved with the features of the claims.

### TECHNICAL SOLUTION

[0013] A cleaner includes: a suction motor that generates suction force; a suction unit that guides air and dust sucked by the suction force generated by the suction motor; a dust separation unit that separates dust from the air guided through the suction unit; a main PCB that generates control signals for the suction motor and includes a first PCB and a second PCB spaced apart from each other; a handle unit that receives the main PCB; and a PCB connector that connects the first PCB and the second PCB to each other and is coupled to the handle unit.

### ADVANTAGEOUS EFFECTS

[0014] According to the present invention, the main PCB is divided into two PCBs and inserted in the handle body, and the size of the main PCB can be reduced.

[0015] In particular, the two PCBs are erect in parallel with each other and inserted in the handle body, the size of the main PCB unit can be minimized.

[0016] Further, since the main PCB assembly can be coupled to the handle body while it is inserted into the space of the handle body with the two PCBs connected to the PCB connector, the structures for fixing the two PCBs to each other and fixing the two PCBs to the handle body are simple and a user can easily assemble them.

[0017] Further, since the second PCB is connected to the connector when the handle unit is slid on the main body, there is no need for a process of connecting the second PCB to the connector.

### BRIEF DESCRIPTION OF THE DRAWINGS

[0018]

FIG. 1 is a perspective view of a cleaner according to an embodiment of the present invention.

FIG. 2 is a side view of the cleaner according to an embodiment of the present invention.

FIG. 3 is a plan view of the cleaner according to an embodiment of the present invention.

FIG. 4 is a perspective view of the cleaner according to an embodiment of the present invention when seen from under the cleaner.

FIG. 5 is a vertical cross-sectional view of the cleaner according to an embodiment of the present invention.

FIG. 6 is a view showing the main body according to an embodiment of the present invention with the handle unit separated.

FIG. 7 is a perspective view of the handle according to an embodiment of the present invention.

FIG. 8 is a perspective view of a main PCB unit according to an embodiment of the present invention.

FIG. 9 is a front view of the main PCB unit shown in FIG. 8.

FIGS. 10 and 11 are exploded perspective views of the main PCB unit shown in FIG. 8.

FIG. 12 is a perspective view of a PCB connector of the present invention.

FIG. 13 is a perspective view of a connector according to an embodiment of the present invention.

FIG. 14 is a plan view of the connector shown in FIG. 13.

FIG. 15 is a perspective view showing the main PCB unit and the connector that have been coupled.

FIG. 16 is a cross-sectional view showing a second PCB and the connector that have been coupled.

FIG. 17 is a perspective view of a handle body according to an embodiment of the present invention.

FIG. 18 is a cross-sectional view showing the internal structure of a handle.

FIG. 19 is a cross-sectional view after the main PCB unit is coupled to the handle body.

FIG. 20 is a view after a power PCB is seated on a support rib, with the main PCB unit coupled to the handle body.

FIG. 21 is a view when a handle cover and an operation unit are combined in the state shown in FIG. 20.

FIG. 22 is a view when the handle unit according to an embodiment of the present invention is coupled to the main body after being assembled.

## DETAILED DESCRIPTION OF THE EMBODIMENTS

[0019] Hereinafter, some embodiments of the present disclosure will be described in detail with reference to the accompanying drawings. It should be noted that when components in the drawings are designated by reference numerals, the same components have the same reference numerals as far as possible even though the components are illustrated in different drawings. Further, in description of embodiments of the present disclosure, when it is determined that detailed descriptions of well-known configurations or functions disturb understanding of the embodiments of the present disclosure, the detailed descriptions will be omitted.

[0020] Also, in the description of the embodiments of the present disclosure, the terms such as first, second, A, B, (a) and (b) may be used. Each of the terms is merely used to distinguish the corresponding component from other components, and does not delimit an essence, an order or a sequence of the corresponding component. It should be understood that when one component is "connected", "coupled" or "joined" to another component, the former may be directly connected or joined to the latter or may be "connected", coupled" or "joined" to the latter with a third component interposed therebetween.

[0021] FIG. 1 is a perspective view of a cleaner according to an embodiment of the present invention, FIG. 2 is a side view of the cleaner according to an embodiment of the present invention, FIG. 3 is a plan view of the cleaner according to an embodiment of the present invention, FIG. 4 is a perspective view of the cleaner according to an embodiment of the present invention when seen from under the cleaner, and FIG. 5 is a cross-sectional view of the cleaner according to an embodiment of the present invention.

[0022] Referring to FIGS. 1 to 5, a cleaner 1 according to an embodiment of the present invention may include a main body 2.

[0023] The cleaner 1 may further include a suction unit 5 coupled to the front of the main body 2. The suction unit 5 can guide air containing dust into the main body 2.

[0024] The cleaner 1 may further include a handle unit 3 coupled to the main body 2. The handle unit 3 may be positioned opposite to the suction unit 5 on the main body 2.

[0025] That is, the main body 2 may be disposed between the suction unit 5 and the handle unit 3.

[0026] The main body 2 may include a first body 10 and a second body 12 on the first body 10. The first body 10 and the second body 12 may be directly combined or may be indirectly combined through an intermediate member.

[0027] The first body 10 and the second body 12 may be, though not limited thereto, formed in a cylindrical shape.

[0028] The first body 10 and the second body 12 are open at the top and the bottom, respectively. That is, the bodies 10 and 12 may have a top opening and a bottom opening, respectively.

[0029] The suction unit 5 may be coupled to the main body 2 such that the center of the suction unit 5 is positioned approximately at the boundary between the first body 10 and the second body 12.

[0030] The main body 2 may further include a dust separation unit that separates dust from air sucked through the suction unit 5.

[0031] The dust separation unit may include a first cyclone unit 180 that can separate dust, for example, using cyclonic flow. The first body 10 includes the first cyclone unit 180 in this configuration.

[0032] The air and dust sucked through the suction unit 5 helically flow along the inner side of the first cyclone unit 180.

[0033] The axis of the cyclonic flow in the first cyclone unit 110 may vertically extend.

[0034] The dust separation unit may further include a second cyclone unit 130 that secondarily separates dust from the air discharged out of the first cyclone unit 110. The second cyclone unit 130 may be disposed inside the first cyclone unit 110 to minimize the size of the dust separation unit. The second cyclone unit 130 may include a plurality of cyclone bodies arranged in a row.

[0035] As another example, the dust separation unit

may include one cyclone unit, in which the axis of the cyclonic flow may also vertically extend.

**[0036]** The first body 10 functions as a dust container that stores dust separated by the cyclone units 110 and 130.

**[0037]** The main body 2 may further include a body cover 16 for opening/closing the bottom of the first body 10. The body cover 16 can open/close the first body 10 by being rotated. A button 18 for rotating the body cover 16 may be disposed on the first body 10. A hinge 162 of the body cover 16 may be coupled to hinge coupling portions 620 of the battery housing 60.

**[0038]** At least a portion of the second cyclone unit 130 may be positioned inside the first body 10.

**[0039]** A dust storage guide 124 that guides the dust separated by the second cyclone unit 130 to be stored may be disposed in the first body 10. The dust storage guide 124 may be coupled to the bottom of the second cyclone unit 130 in contact with the top of the body cover 16.

**[0040]** The dust storage guide 124 may divide the internal space of the first body 10 into a first dust storage part 121 where the dust separated by the first cyclone unit 110 is stored and a second dust storage part 123 where the dust separated by the second cyclone unit 130 is stored.

**[0041]** The internal space of the dust storage guide 124 is the second dust storage part 123 and the space between the dust storage guide 124 and the first body 10 is the first dust storage part 121.

**[0042]** The body cover 16 can open/close both of the first dust storage part 121 and the second dust storage part 123.

**[0043]** The cleaner 1 may further include a suction motor 20 for generating suction force and a battery 40 for supplying power to the suction motor 20.

**[0044]** The suction motor 20 may be disposed in the second body 12. At least a portion of the suction motor 20 may be disposed over the dust separation unit. Accordingly, the suction motor 20 is disposed over the first body 10.

**[0045]** The suction motor 20 may communicate with an outlet of the second cyclone unit 130.

**[0046]** To this end, the main body 2 may further include a discharge guide 28 connected to the second cyclone unit 130 and a flow guide 22 that communicates with the discharge guide 28.

**[0047]** For example, the discharge guide 28 is disposed on the second cyclone unit 130 and the flow guide 22 is disposed over the discharge guide 28.

**[0048]** Further, at least a portion of the suction motor 20 is positioned inside the flow guide 22.

**[0049]** Accordingly, the axis of the cyclonic flow in the first cyclone unit 110 may pass through the suction motor 20.

**[0050]** When the suction motor 20 is disposed over the second cyclone unit 130, the air discharged from the second cyclone unit 130 can flow directly to the suction motor

20, so the channel between the dust separation unit and the suction motor 20 can be minimized.

**[0051]** The suction motor 20 may include a rotary impeller 200. The impeller 200 may be fitted on a shaft 202. The shaft 202 is vertically disposed.

**[0052]** An extension line from the shaft 202 (which may be considered as the rotational axis of the impeller 200) may pass through the first body 10. The rotational axis of the impeller 200 and the axis of the cyclonic flow in the first cyclone unit 180 may be on the same line.

**[0053]** According to the present invention, there is the advantage that the path through which the air discharged from the dust separation unit, that is, the air discharged upward from the second cyclone unit 190 flows to the suction motor 20 can be reduced and a change in direction of air can be decreased, so a loss of airflow can be reduced.

**[0054]** As the loss of airflow is reduced, suction force can be increased and the lifetime of the battery 40 for supplying power to the suction motor 20 can be increased.

**[0055]** The cleaner 1 may further include an upper motor housing 26 covering a portion of the top of the suction motor 20 and a lower motor housing 27 covering a portion of the bottom of the suction motor 20.

**[0056]** The suction motor 20 may be disposed inside the motor housings 26 and 27 and the flow guide 22 may be disposed to cover the upper motor housing 26.

**[0057]** At least a portion of the flow guide 22 may be spaced apart from the upper motor housing 26. Further, at least a portion of the flow guide 22 may be spaced apart from the second body 12.

**[0058]** Accordingly, a first air passage 232 is defined by the inner side of the flow guide 22 and the outer side of the upper motor housing 26 and a second air passage 234 is defined by the outer side of the flow guide 22 and the inner side of the second body 12.

**[0059]** The air discharged from the second cyclone unit 190 flows to the suction motor 20 through the first air passage 232 and the air discharged from the suction motor 20 flows through the second air passage 234 and is then discharged outside. Accordingly, the second air passage 234 functions as an exhaust channel.

**[0060]** The handle unit 3 may include a handle 30 for a user to hold and a battery housing 60 under the handle 30.

**[0061]** The handle 30 may be disposed behind the suction motor 20.

**[0062]** As for directions, with respect to the suction motor 20 in the cleaner 1, the direction in which the suction unit 5 is positioned is the front direction and the direction in which the handle 30 is positioned is the rear direction.

**[0063]** The battery 40 may be disposed behind the first body 10. Accordingly, the suction motor 20 and the battery 40 may be arranged not to vertically overlap each other and may be disposed at different heights.

**[0064]** According to the present invention, since the suction motor 20 that is heavy is disposed ahead of the

handle 30 and the battery 40 that is heavy is disposed behind the handle 30, so weight can be uniformly distributed throughout the cleaner 1. It is possible to prevent injuries to the user's wrist when a user cleans with the handle 30 in his/her hand. That is, since the heavy components are distributed at the front and rear portions and at different heights in the cleaner 1, it is possible to prevent the center of gravity of the cleaner 1 from concentrating on anyone side.

**[0065]** Since the battery 40 is disposed under the handle 30 and the suction motor 20 is disposed in front of the handle 30, there is no component over the handle 30. That is, the top of the handle 30 forms a portion of the external appearance of the top of the cleaner 1.

**[0066]** Accordingly, it is possible to prevent any component of the cleaner 1 from coming in contact with the user's arm while the user cleans with the handle 30 in his/her hand.

**[0067]** The handle 30 may include a first extension 310 extending vertically to be held by a user and a second extension 320 extending toward the suction motor 20 over the first extension 310. The second extension 320 may at least partially horizontally extend. In the present invention, the first extension 310, which is a portion that a user can hold (a portion that a user's palm can come in contact with), may be referred to as a grip part.

**[0068]** A stopper 312 for preventing a user's hand holding the first extension 310 from moving in the longitudinal direction of the first extension 310 (vertically in FIG. 2) may be formed on the first extension 310. The stopper 312 may extend toward the suction unit 5 from the first extension 310.

**[0069]** The stopper 312 is spaced apart from the second extension 320. Accordingly, a user is supposed to hold the first extension 310, with some of the fingers over the stopper 312 and the other fingers under the stopper 312.

**[0070]** For example, the stopper 312 may be positioned between the index finger and the middle finger.

**[0071]** According to this arrangement, when a user holds the first extension 310, the longitudinal axis A1 of the suction unit 5 may pass through the user's wrist.

**[0072]** When the longitudinal axis A1 of the suction unit 5 passes through the user's wrist and the user's arm is stretched, the longitudinal axis A1 of the suction unit 5 may be substantially aligned with the user's stretched arm. Accordingly, there is the advantage in this state that the user uses minimum force when pushing or pulling the cleaner 1 with the handle 30 in his/her hand.

**[0073]** The handle 30 may include an operation unit 390. For example, the operation unit 390 may be disposed on an inclined surface of the second extension 320. It is possible to input instructions to turn on/off the cleaner (suction motor) through the operation unit 390. For example, it is possible to input instructions to turn on/off the suction motor through the operation unit 390. Further, it is possible to control the intensity of the suction force of the suction motor 20 that has been turned on

through the operation unit 390.

**[0074]** The operation unit 390 may be disposed to face a user. The operation unit 390 may be disposed opposite to the stopper 312 with the handle 30 therebetween.

**[0075]** The operation unit 390 is positioned higher than the stopper 312. Accordingly, a user can easily operate the operation unit 390 with his/her thumb with the first extension 310 in his/her hand.

**[0076]** Further, since the operation unit 390 is positioned outside the first extension 310, it is possible to prevent the operation unit 390 from being unexpectedly operated when a user cleans with the first extension 310 in his/her hand.

**[0077]** The battery housing 60 may be disposed under the first extension 310.

**[0078]** The battery 40 may be detachably combined with the battery housing 60. For example, the battery 40 may be inserted into the battery housing 60 from under the battery housing 60.

**[0079]** The rear side of the battery housing 60 and the rear side of the first extension 310 may form a continuous surface. Accordingly, the battery housing 60 and the first extension 310 can be shown like a single unit.

**[0080]** When the battery 40 is inserted in the battery housing 60, the bottom of the battery 40 may be exposed to the outside. Accordingly, when the cleaner 1 is placed on the floor, the battery 40 can be in contact with the floor.

**[0081]** According to this structure, there is the advantage that the battery 40 can be directly separated from the battery housing 60.

**[0082]** Further, since the bottom of the battery 40 is exposed to the outside, the bottom of the battery 40 can come in direct contact with the air outside the cleaner 1, so the battery 40 can be more efficiently cooled.

**[0083]** The battery housing 60 may have charging stand connection terminals 628 for charging the battery 40 coupled to the battery housing 60. It is possible to bring the charging stand connection terminals 628 in contact with a terminal of a charging stand (not shown) by placing the cleaner 1 on the charging stand.

**[0084]** The battery housing 60 may have battery connection terminals 670 that are connected to battery terminals 490 in the battery 40 inserted in the battery housing 60. The battery connection terminals 670 may be connected to the battery terminals 490 through the top of the battery 40.

**[0085]** Referring to FIG. 3, the cleaner 1 may further include a filter unit 50 having air exits 522 for discharging the air that has passed through the suction motor 20. For example, the air exits 522 may include a plurality of openings and the openings may be circumferentially arranged. Accordingly, the air exist 522 may be arranged in a ring shape.

**[0086]** The filter unit 50 may be detachably coupled to the top of the main body 2. The filter unit 50 may be detachably inserted in the second body 12.

**[0087]** When the filter unit 50 is combined with the main body 2, a portion of the filter unit 50 is positioned outside

the second body 12. Accordingly, a portion of the filter unit 50 is inserted in the main body 2 through the open top of the main body 2 and the other portion protrudes outside from the main body 2.

**[0088]** The height of the main body 2 may be substantially the same as the height of the handle 30. Accordingly, the filter unit 50 protrudes upward from the main body 2, so a user can easily hold and separate the filter unit 50.

**[0089]** When the filter unit 50 is combined with the main body 2, the air exits 522 are positioned at the upper portion of the filter unit 50. Accordingly, the air discharged from the suction motor 20 is discharged upward from the main body 2.

**[0090]** According to this embodiment, it is possible to prevent the air discharged from the air exits 522 from flowing to a user while the user cleans using the cleaner 1.

**[0091]** The main body 2 may further include a pre-filter 29 for filtering the air flowing into the suction motor 20. The pre-filter 29 may be disposed inside the flow guide 22. Further, the pre-filter 29 is seated over the upper motor housing 16 and may surround a portion of the upper motor housing 26. That is, the upper motor housing 26 may include a filter support for supporting the pre-filter 29.

**[0092]** FIG. 6 is a view showing the main body according to an embodiment of the present invention with the handle unit separated and FIG. 7 is a perspective view of the handle unit according to an embodiment of the present invention.

**[0093]** The handle unit 3 may include a handle body 332 and a handle body cover 334 that covers the handle body 332.

**[0094]** The handle body 332 forms a portion of the first extension 310 and a portion of the second extension 320. The handle cover 334 forms the other portion of the first extension 310 and the other portion of the second extension 320.

**[0095]** That is, when the handle cover 334 is coupled to the handle body 332, the handle body 332 and the handle cover 334 form the first extension 310 and the second extension 320.

**[0096]** The handle body 332 may form not only the handle 30, but the battery housing 60.

**[0097]** The handle unit 3 may further have a main body coupling portion 70 for coupling the handle unit 3 to the main body 2. The handle 30 and the battery housing 60 can be coupled through the main body coupling portion 70.

**[0098]** The handle unit 3 may further have a main PCB (Printed circuit board) unit 340 for controlling the suction motor 20.

**[0099]** The main PCB unit 340, for example, may be inserted in the internal space of the second extension 320.

**[0100]** The main body 2 may further have a connector support 136 for supporting a connector 400.

**[0101]** The connector 400 may be connected with the suction motor 20 in the main body 2. Further, the con-

connector 400 may be connected with the main PCB unit 340. The connector 400 transmits control signals from the main PCB unit 340 to the suction motor 20. The connector 400 may have a signal terminal for transmitting the control signals.

**[0102]** The main body 2 may further have a stopper rib 136a for preventing the connector 400 supported by the connector support 136 from separating upward.

**[0103]** The stopper rib 136a is spaced from the connector support 136. The connector 400 may be inserted in the space between the connector support 136a and the stopper rib 136a. For example, the connector 400 may be horizontally slid on the connector support 136.

**[0104]** The connector support 136 and the stopper rib 136a may be, for example, formed on the second body 12.

**[0105]** The main body 2 may have a main body terminal 80 and the handle unit 3 may further have a handle terminal 90. The handle terminal 90 may be connected with the main PCB unit 340.

**[0106]** The main body terminal 80 may be disposed on a cover member 70 coupled to the main body 2. The main body terminal 80 may be connected to the handle terminal 90 when the handle unit 3 is coupled to the main body 2.

**[0107]** A plurality of main body wires 141 and 142 may be connected to the main body terminal 80. The main body wires 141 and 142 may be connected to the main body terminal 80 from under the main body terminal 80.

**[0108]** The main body wires 141 and 142 may include a pair of first wires 141 connected to the suction motor 20 to supply power to the suction motor 20 and a pair of second wires 142 connected to the suction unit 5.

**[0109]** The main body wires 141 and 142 may be inserted into the main body 2 through a packing 138 on the main body 2.

**[0110]** According to this embodiment, since a signal terminal for transmitting control signals and a control terminal for supplying power are separated and disposed at different positions, an increase in size of the main body terminal 80 can be prevented.

**[0111]** The handle unit 3 may have a body coupling portion 304 for coupling the main body 2 and the main body 2 may have a handle coupling portion 139a for coupling the body coupling portion 304. The handle unit 3 may be vertically slide-coupled to the main body 2 by the body coupling portion 304 and the handle coupling portion 139a.

**[0112]** Further, when the handle unit 3 is coupled to the main body 2, the PCB unit 340 can be connected with the connector 400 and the handle terminal 90 can be connected with the main body terminal 80.

**[0113]** The handle unit 3 may further include a plurality of handle wires 942, 944, and 946. The handle wires 942, 944, and 946 may be connected to the main PCB unit 340.

**[0114]** The main PCB unit 340 may be connected to the battery 40. Further, the main PCB unit 340 may receive operation signals from the operation unit 390. The

main PCB unit 340 may supply power to the suction motor 20 and/or a suction unit terminal in the suction unit or control the intensity of the suction force of the suction motor 20 on the basis of the input operation signals.

**[0115]** The handle wires 942, 944, and 946 may include first handle wires 942 connected to the handle terminal 90 to supply power to the suction unit terminal and second handle wires 944 connected to the handle terminal 90 to supply power to the suction motor 20.

**[0116]** When the handle terminal 90 is connected to the main body terminal 80, the first handle wires 942 may be connected to the first main body wires 141 of the main body 2 and the second handle wires 944 may be connected to the second main body wires 142 of the main body 2.

**[0117]** The handle wires 942, 944, and 946 may further have terminal connection wires 946 connected to the cradle connection terminals 628.

**[0118]** The handle unit 3 may further have wire guides 309 that guide the handle wires to prevent the handle wires 942, 944, and 946 from getting entangled.

**[0119]** The structure of the main PCB unit 340 and a method of assembling the main PCB unit 340 are described hereafter.

**[0120]** The structure of the main PCB unit is described in detail hereafter.

**[0121]** FIG. 8 is a perspective view of the main PCB unit according to an embodiment of the present invention, FIG. 9 is a front view of the main PCB unit shown in FIG. 8, and FIGS. 10 and 11 are exploded perspective views of the main PCB unit shown in FIG. 8. FIG. 12 is a perspective view of a PCB connector of the present invention.

**[0122]** Referring to FIGS. 8 to 12, the main PCB unit 340 according to this embodiment may include a main PCB 341.

**[0123]** The main PCB 341 may be composed of a plurality of separate PCBs to be disposed inside the second extension 320. That is, the main PCB 341 may include a first PCB 342 and a second PCB 344.

**[0124]** The first PCB 342 and the second PCB 344 may be erect in parallel with each other. The first PCB 342 and the second PCB 344 may be horizontally spaced apart from each other.

**[0125]** One or more connection terminals 348 for connecting the first PCB 342 and the second PCB 344 may be disposed between the PCBs.

**[0126]** The main PCB unit 340 may further include a PCB connector 350 for connecting the first PCB 342 and the second PCB 344 to each other.

**[0127]** The PCB connector 350 can mechanically connect the first PCB 342 and the second PCB 344 to each other.

**[0128]** The PCB connector 350 may include a connector body 351 on which the first PCB 342 and the second PCB 344 may be mounted.

**[0129]** The connector body 351 may be formed in a plate shape. The PCB connector 350 may further include

one or more spacers 352 for maintaining the first PCB 342 and the second PCB 344 spaced apart from each other.

**[0130]** The spacers 352 may protrude downward from the bottom 351a of the connector body 351.

**[0131]** A coupling protrusion 353 for coupling the first PCB 342 and the second PCB 344 may be formed on both sides of each of the spacers 352. Further, protrusion coupling portions 346 and 347 for coupling the coupling protrusions 353 may be formed at the PCBs 342 and 344. The protrusion coupling portions 346 and 347 may be grooves or holes.

**[0132]** In this specification, the PCB connector 350 and the main PCB 341 combined with each other may be called as a main PCB assembly.

**[0133]** The width of the spacers 352 may be smaller than the width of the connector body 351 so that the connector body 351 can be seated on the tops of the first PCB 342 and the second PCB 344 when the coupling protrusions 353 of the PCB connector 350 are fitted in the protrusion coupling portions 346 and 347 of the PCBs 342 and 344.

**[0134]** Further, the spacers 352 may be spaced apart from the lateral sides 351b and 351c of the connector body 351.

**[0135]** When the connector body 351 is seated on the tops of the first PCB 342 and the second PCB 344, with the coupling protrusions 353 of the PCB connector 350 fitted in the protrusion coupling portions 346 and 347 of the PCBs 342 and 344, the height of the main PCB unit 340 can be reduced.

**[0136]** The connector body 351 may be spaced apart from the tops of the first PCB 342 and the second PCB 344, with the coupling protrusions 353 of the PCB connector 350 fitted in the protrusion coupling portions 346 and 347 of the PCBs 342 and 344.

**[0137]** Further, when the spacers 352 are spaced apart from the lateral sides 351b and 351c of the connector body 351, the width of the main PCB unit 340 can be reduced with the coupling protrusions 353 of the PCB connector 350 fitted in the protrusion coupling portions 346 of the PCBs 342 and 344.

**[0138]** When the PCB connector 350 has the spacers 352, the spacers 352 may be spaced apart from each other in the longitudinal direction of the connector body 351.

**[0139]** The PCB connector 350 may include a coupling hook 357 for coupling the handle body 332.

**[0140]** The coupling hook 357 may horizontally extend from the connector body 351.

**[0141]** A reinforcing rib 354 may be formed on the bottom 351a of the connector body 351 to prevent damage to the coupling hook 357 when the PCB connector 350 and the handle body 332 are coupled by the coupling hook 357.

**[0142]** Though not limited, the reinforcing rib 354 may protrude from the bottom 351a of the connector body 351 and may connect the coupling hook 357 and one or more

of the spacers 352 to each other.

**[0143]** If the PCB connector 350 has a plurality of spacers 352, the reinforcing rib 354 may connect the coupling hook 357 and the spacer 352, which is closest to the coupling hook 357 of the spacers 352, to each other.

**[0144]** A light emitting unit 370 for displaying the state of the cleaner 1 may be disposed on any one of the first PCB 342 and the second PCB 344.

**[0145]** For example, the light emitting unit 370 is disposed on the second PCB 344 in FIG. 11. The light emitting unit 370 may include one or more LEDs. For example, in FIG. 11, the light emitting unit 370 includes a plurality of LEDs 371, 372, and 373 spaced apart from each other in the longitudinal direction of the connector body 351.

**[0146]** Though not limited, it is possible to display the remaining capacity of the battery 40 and the intensity of the suction force of the suction motor 20, using the LEDs 371, 372, and 373.

**[0147]** The connector body 351 may include a plurality of light holes 355 for passing the light from the LEDs 371, 372, and 373.

**[0148]** The light holes 355 may be spaced apart from each other in the longitudinal direction of the connector body 351, and when the PCB connector 350 is coupled to the PCBs 342 and 344, the light holes 355 can be aligned with the LEDs 371, 372, and 373.

**[0149]** The spacers 352 are each positioned between two adjacent light holes 355 not to interfere with the light from the LEDs 371, 372, and 373.

**[0150]** According to this configuration, the spacers 352 do not interfere with the light from the LEDs 371, 372, and 373 and also each prevent interference between the light from adjacent two LEDs. That is, the spacers 352 each separate the paths of the light from two adjacent LEDs.

**[0151]** The PCBs 342 and 344 may include extensions 343 and 345, respectively, for supporting a power PCB 380. The extensions 343 and 345 may include inclined surfaces 343a and 345a, respectively, for supporting at an angle the power PCB 380.

**[0152]** A first connection terminal 349 that is connected to the power PCB 380 may be disposed on any one of the first PCB 342 and the second PCB 344.

**[0153]** For example, the first connection terminal 349 is disposed on a first extension 343 of the first PCB 342 in FIG. 11.

**[0154]** Any one of the first PCB 342 and the second PCB 344 may be connected to the connector 400 in the main body 20

**[0155]** In the following description, it is exemplified that the connector 400 is connected to the second PCB 344.

**[0156]** The main PCB unit 340 may further include a PCB cover 360 that covers upper portions of the PCBs 342 and 344 and the PCB connector 350.

**[0157]** The PCB cover 360 may include a top portion 361 covering the top of the PCB connector 350 and a pair of side portions 362 and 363 extending downward

from both sides of the top portion 361.

**[0158]** The side portions 362 and 363 can cover not only the PCB connector 350, but a portion of the upper portions of the PCBs 342 and 344.

**[0159]** The side portions 362 and 363 can prevent the PCBs 342 and 344 coupled to the PCB connector 350 from horizontally moving in the handle 30.

**[0160]** The PCB cover 360 covers the light holes 355 of the connector body 351. The PCB cover 360 may include a plurality of light transmissive portions 364 so that the light passing through the light holes 355 can pass through the PCB cover 360. The light transmissive portions 364 are the same in number as the light holes 355 and face the light holes 355.

**[0161]** The light transmissive portions 364 may protrude upward from the top portion 361 of the PCB cover 360.

**[0162]** At least the light transmissive portions 364 of the PCB cover 360 may be transparent or translucent.

**[0163]** Meanwhile, the second PCB 344 may have a plurality of contact pads for electrical connection with the connector.

**[0164]** The contact pads may be disposed on both sides of the second PCB 344.

**[0165]** The contact pads may include one or more first pads 3442 on a first side 3440a of the second PCB 344 and a second pad 3444 spaced from the first pads 3442. For example, the first pads 3442 and the second pad 3444 are horizontally spaced apart from each other.

**[0166]** The contact pads may further include one or more third pads 3443 on a second side 3440b that is the opposite side to the first side 3440a and a fourth pad 3445 spaced from the third pads 3443. For example, the third pads 3443 and the fourth pad 3445 are horizontally spaced apart from each other.

**[0167]** On the second PCB 344, the first pads 3442 and the third pads 3443 face with each other and, the second pad 3444 and the fourth pad 3445 face with each other.

**[0168]** The second PCB 344 may have a slit 3441 for coupling the second PCB 344 and the connector in position.

**[0169]** The slit 3441 is disposed between the first pads 3442 and the second pad 3444. Accordingly, the slit 3441 is disposed also between the third pads 3443 and the fourth pad 3445. The slit 3441 may be formed by cutting an end portion, where the pads are disposed, of the second PCB 344.

**[0170]** FIG. 13 is a perspective view of the connector according to an embodiment of the present invention, FIG. 14 is a plan view of the connector shown in FIG. 13, FIG. 15 is a perspective view showing the main PCB unit and the connector that have been coupled, and FIG. 16 is a cross-sectional view showing the second PCB and the connector that have been coupled.

**[0171]** Referring to FIGS. 13 and 16, the connector 400 of this embodiment may have a first connecting body 410, a second connecting body 420 spaced apart from

the first connecting body 410, and a bridge body 430 connecting the first connecting body 410 and the second connecting body 420 to each other.

**[0172]** The bridge body 430 may connect the first connecting body 410 and the lower portion of the second connecting body 420 to each other so that the second PCB 344 can be coupled to the connector 400 from above the connector 400.

**[0173]** Accordingly, a PCB space 450 for receiving the second PCB 344 is defined between the first connecting body 410 and the second connecting body 420.

**[0174]** One or more first connecting pins 442 and a second connecting pin 443 spaced apart from the first connecting pins 442 may be disposed on the side, which faces the second connecting body 420, of the first connecting body 410. The first connecting pins 442 and the second connecting pin 443 may be horizontally spaced apart from each other.

**[0175]** One or more third connecting pins 444 and a fourth connecting pin 445 spaced from the first connecting pins 444 may be disposed on the side, which faces the first connecting body 410, of the second connecting body 420. The third connecting pins 444 and the fourth connecting pin 443 may be horizontally spaced apart from each other.

**[0176]** The first connecting pins 442 and the third connecting pins 444 may be spaced from and face each other. The second connecting pin 443 and the fourth connecting pin 444 may be spaced from and face each other.

**[0177]** Some of the connecting pins 442 to 445 may be disposed inside the connecting bodies 410 and 420, respectively, and the others may protrude toward the PCB space 450 from the connecting bodies 410 and 420.

**[0178]** The connecting pins 442 to 445, for example, may be elastically deformable conductors, so the connecting pins 442 to 445 protruding from the connecting bodies 410 and 420, respectively, may be pressed inside the connecting bodies 410 and 420, respectively, by external force

**[0179]** Alternatively, the connecting pins 442 to 445 may be conductor and fixed to the connecting bodies 410 and 420, respectively.

**[0180]** A slit insertion protrusion 412 that is inserted in the slit 3441 of the second PCB 344 may be formed on the PCB space 450.

**[0181]** The slit insertion protrusion 412 may be disposed between the first connecting pins 442 and the second connecting pin 443. Accordingly, the slit insertion protrusion 412 is disposed also between the third connecting pins 444 and the fourth connecting pin 445.

**[0182]** The slit insertion protrusion 412 may protrude to the PCB space 450 from the bridge body 430. For example, the slit insertion protrusion 412 may protrude upward from the bridge body 430.

**[0183]** Alternatively, the slit insertion protrusion 412 may be formed on any one of the connecting bodies 410 and 420 and protrude toward the other one. Alternatively, the slit insertion protrusion 412 may connect the first con-

necting body 410 and the second connecting body 420 to each other.

**[0184]** A protrusion seat 414 on which the stopper rib 136a described with reference to FIG. 6 is seated may be formed on any one of the first connecting body 410 and the second connecting body 420. FIG. 13 shows an example in which the protrusion 414 is formed on the first connecting body 410.

**[0185]** On the other hand, the second PCB 344 may be inserted into the PCB space 450 from above the connector 400.

**[0186]** When the second PCB 344 is inserted into the PCB space 450, the slit insertion protrusion 412 can be inserted into the slit 3441 of the second PCB 344.

**[0187]** When the slit insertion protrusion 412 is inserted in the slit 3441 of the second PCB 344, the second PCB 344 is normally connected to the connector 400.

**[0188]** In this state, the pads 3442 to 3445 are in contact with the connecting pins 442 to 445, respectively, in position.

**[0189]** According to the present invention, when the slit insertion protrusion 412 is inserted in the slit 3441 of the second PCB 344, the pads 3442 to 3445 are in contact with the connecting pins 442 to 445, misassembly of the second PCB 344 and the connector 400 is prevented.

**[0190]** Further, as misassembly of the second PCB 344 and the connector 400 is prevented, a short circuit due to connection of two adjacent pads through a connecting pin can be prevented.

**[0191]** According to the present invention, since the second PCB 344 is inserted between the two connecting bodies 410 and 420 and the slit insertion protrusion 412 is inserted in the slit 3441 of the second PCB 344, there is no need for an additional fixing member such as a hook for fixing the second PCB 344 and the connector 400.

**[0192]** Further, in the present invention, the first connecting pins 422 and the third connecting pins 444 have the same function, and the second connecting pin 443 and the fourth connecting pin 445 have the same function.

**[0193]** Further, on the second PCB 344, the first pads 3442 and the third pads 3443 have the same function, and the second pad 3444 and the fourth pad 3445 has the same function.

**[0194]** Accordingly, since the pads 3442 to 3445 are disposed on both sides of the second PCB 344 and the second PCB 344 is inserted between the two connecting bodies 410 and 420, signals can be transmitted as long as the pads 3442 to 3445 on one of both sides of the second PCB 344 are connected to the connecting pins 442 to 445, so the second PCB 344 and the connector 400 can be more accurately connected.

**[0195]** It may be possible to form a wedge on the slit insertion protrusion 412 and form an additional groove on the slit 3441 to receive the wedge in order to more firmly combine the second PCB 344 and the connector 400.

**[0196]** FIG. 17 is a perspective view of the handle body

according to an embodiment of the present invention, FIG. 18 is a cross-sectional view showing the internal structure of a handle according to an embodiment of the present invention, FIG. 19 is a cross-sectional view when the main PCB unit is coupled to the handle body according to an embodiment of the present invention, FIG. 20 is a view showing the power PCB seated on the support rib with the main PCB unit coupled to the handle body, and FIG. 21 is a view when the handle cover and the operation unit are combined in the state shown in FIG. 20.

**[0197]** FIG. 22 is a view when the handle unit according to an embodiment of the present invention is coupled to the main body after being assembled.

**[0198]** A space 322 for receiving the main PCB unit 340 may be defined in the handle body 332. The space 322 is a space substantially defined in the second extension 320.

**[0199]** The handle body 332 may include a support 324 that supports the main PCB unit 340.

**[0200]** The support 324 may include a seat 324a on which the main PCB unit 340 is seated, a first rib 324b that supports the first PCB 342 on the seat 324a, and a second rib 324c that supports the second PCB 344 on the seat 324a.

**[0201]** The ribs 324b and 324c may protrude upward from the seat 324a.

**[0202]** The main PCB unit 340 on the support 324 cannot be moved left and right in FIG. 16 by the first rib 324b and the second rib 324c.

**[0203]** Further, the first rib 324b and the second rib 324c guide the main PCB assembly that is inserted into the space 322 of the handle body 332.

**[0204]** The handle body 332 may further include a plurality of insertion holes 364 for inserting the light transmissive portions 364 of the PCB cover 360.

**[0205]** When being inserted in the insertion holes 327, the light transmissive portions 364 may be exposed to the outside of the handle 30. Accordingly, a user can visually check the light from the LEDs 371, 372, and 373 through the light transmissive portions 364.

**[0206]** In this embodiment, since the light transmissive portions 364 are inserted in the insertion holes 327, it is possible to prevent external moisture or dirt from flowing to the main PCB 341 through the insertion holes 327.

**[0207]** The handle body 332 may further include a connector coupling portion 325 to which the PCB connector 350 is coupled when the main PCB assembly is inserted into the space 322.

**[0208]** The connector coupling portion 325 may include a hole 325a for passing the coupling hook 357 of the PCB connector 350 and a hook locking rib 325b for locking the coupling hook 357 that has passed through the hole 325a.

**[0209]** Meanwhile, the power PCB 380 may include a first switch 382 and a second switch 384 for receiving operation instructions from the operation unit 390. Though not limited, the first switch 382 may receive instructions to turn on/off the suction motor 20 and the sec-

ond switch 384 may receive instructions to control the intensity of the suction force of the suction motor 20.

**[0210]** The handle body 332 may further include a support rib 326 for supporting the power PCB 380. The support rib 326 may extend downward from the connector coupling portion 325.

**[0211]** The support rib 326 may include an inclined surface 326a so that the power PCB 380 can be positioned at an angle. Accordingly, when the power PCB 380 is supported by the inclined surface 326a, the first switch 382 and the second switch 384 are at different heights.

**[0212]** When the main PCB unit 340 is coupled to the handle body 332, the support rib 326 is positioned between the first PCB 342 and the second PCB 344. The support rib 326 is spaced apart from the first PCB 342 and the second PCB 344 in order not to damage the main PCB 341 when the main PCB unit 340 is coupled.

**[0213]** The inclination angle of the inclined surface 326a of the support rib 326 may be the same as the inclination angles 343a and 345a of the extensions 343 and 345 of the PCBs 342 and 344.

**[0214]** Accordingly, the inclined surfaces 343a and 345a of the PCBs 342 and 344 and the inclined surface 326a of the support rib 326 can support the power PCB 380.

**[0215]** Obviously, the inclined surfaces 343a and 345a of the PCBs 342 and 344 may be spaced apart from the power PCB 380, with the power PCB 380 in contact with the inclined surface 326a of the support rib 326.

**[0216]** The handle body 332 may further include a fitting rib 326b passing through the power PCB 380 to prevent the power PCB 380 being in contact with the inclined surface 326a of the support rib 326 from moving left and right in FIG. 15. Further, a slit 386 for passing the fitting rib 326b may be formed in the power PCB 380.

**[0217]** The fitting rib 326b may be formed at the lower portion of the support rib 326. When the power PCB 380 is seated on the inclined surface 326a of the support rib 326, the fitting rib 326b is fitted in the slit 386, so it is possible to prevent the power PCB 380 from sliding down on the inclined surface 326a of the support rib 326 in the process of assembling the power PCB 380.

**[0218]** The handle body 332 may further include a top stopper 328 for preventing the power PCB 380 on the support rib 326 from moving up.

**[0219]** The handle body 332 may further include a fastening boss 329 for fastening the power PCB 380 on the support rib 326 using a fastener (not shown) such as a screw.

**[0220]** A hole 381 for passing the fastener may be formed through the power PCB 380.

**[0221]** On the other hand, the operation unit 390 may include a support frame 396 for coupling to the handle cover 334 and an operation button 391 combined with the support frame 396.

**[0222]** The operation button 391 may include a first pushing portion 392 for pressing the first switch 382 and a second pushing portion 394 for pressing the second

switch 384. That is, one operation button 391 may include two pushing portions 392 and 394.

**[0223]** According to the present invention, since the power PCB 380 is inclined with the first switch 382 and the second switch 384 at different heights, a user can hold the handle 30 and press the first switch 382 or the second switch 384 by operating the operation button 391 with one finger. Accordingly, the user can more conveniently operate the cleaner.

**[0224]** A process of assembling the main PCB unit 340 and the power PCB 380 is described hereafter.

**[0225]** First, the PCB cover 360 is inserted into the space 322 of the handle body 332 such that the light transmissive portions 364 of the PCB cover 360 are inserted into the insertion holes 327 of the handle body 332.

**[0226]** The main PCB assembly is completed by connecting the first PCB 342 and the second PCB 344 through the PCB connector 350 and then the main PCB assembly is inserted into the space between the PCB cover 360 and the support 324 of the handle body 332.

**[0227]** When the main PCB assembly is inserted, the side portions 362 and 363 of the PCB cover 360 and the first and second ribs 324b and 324c of the support 324 guide the main PCB assembly.

**[0228]** When the coupling hook 357 of the PCB connector 350 is locked to the hook locking rib 325b through the hook hole 325a while the main PCB assembly is inserted into the space 322 of the handle body 332, coupling of the main PCB assembly is completed.

**[0229]** In this state, as in FIG. 20, the power PCB 380 is seated on the support rib 326 and then the power PCB 380 may be fixed to the handle body 332 by a fastener.

**[0230]** The power PCB 380 is fixed to the handle body 332 substantially at the same height as the main PCB 341.

**[0231]** Next, as in FIG. 21, the handle cover 334 is coupled to the handle body 332 and then the operation unit 390 may be coupled to the second handle body 334.

**[0232]** Further, as in FIG. 22, it is possible to fix the handle unit 3 to the main body 2 by aligning the handle unit 3 with the main body 2 and then sliding down the handle unit 3.

**[0233]** According to the present invention, the main PCB 341 is divided into two PCBs and inserted in the handle body 332, and the size of the main PCB 341 can be reduced.

**[0234]** In particular, the two PCBs are erect in parallel with each other and inserted in the handle body, the size of the main PCB unit 340 can be minimized.

**[0235]** Further, since the main PCB assembly can be coupled to the handle body 332 while it is inserted into the space 322 of the handle body 332 with the two PCBs connected to the PCB connector 350, the structures for fixing the two PCBs to each other and fixing the two PCBs to the handle body 332 are simple and a user can easily assemble them.

**[0236]** Further, since the second PCB 344 is connected to the connector when the handle unit 3 is slid on the

main body 2, there is no need for a process of connecting the second PCB 344 to the connector.

## 5 Claims

### 1. A cleaner comprising:

a suction motor (20) that generates suction force;  
a suction unit (5) that guides air and dust sucked by the suction force generated by the suction motor (20);  
a dust separation unit that separates dust from the air guided through the suction unit (5);  
a main printed circuit board, PCB (340), that generates control signals for the suction motor (20) and includes a first PCB (342) and a second PCB (344) spaced apart from each other;  
a handle unit (3) that receives the main PCB (340); and  
a PCB connector (350) that connects the first PCB (342) and the second PCB (344) to each other and is coupled to the handle unit (3).

### 2. The cleaner of claim 1, wherein the PCB connector (350) includes a coupling hook (357) for coupling the handle unit (3).

### 3. The cleaner of claim 2, wherein the handle unit (3) includes a handle body (332), and the handle body (332) includes a space (322) for receiving the main PCB (340) and the PCB connector (350), and a connector coupling portion (325) for coupling the coupling hook (357) of the PCB connector (350) in the space (322).

### 4. The cleaner of claim 3, wherein when the first PCB (342) and the second PCB (344) are connected to the PCB connector (350), the first PCB (342) and the second PCB (344) are arranged in parallel with each other.

### 5. The cleaner of claim 3, wherein the coupling hook (357) of the PCB connector (350) is coupled to the connector coupling portion (325), with the first PCB (342) and the second PCB (344) erected.

### 6. The cleaner of claim 3, wherein the handle body (332) further includes a support (324) for supporting the main PCB (340) in the space (322), and the support (324) includes a seat (324a) on which the main PCB (340) is seated, a first rib (324b) that supports the first PCB (342) on the seat (324a), and a second rib (324c) that supports the second PCB (344) on the seat (324a).

### 7. The cleaner of claim 2, wherein the PCB connector

(350) comprises:

a connector body (351) that has the coupling hook (357);  
a spacer (352) that extends from the connector body (351); and  
coupling protrusions (353) that protrude from both sides of the spacer to couple the first PCB (342) and the second PCB (344).

8. The cleaner of claim 7, wherein when the first PCB (342) and the second PCB (344) are coupled to the coupling protrusions (353) on both sides of the spacer (352), the connector body (351) is seated on the tops of the first PCB (342) and the second PCB (344).

9. The cleaner of claim 7, wherein the connector body (351) includes a reinforcing rib (354) for preventing damage to the coupling hook (357).

10. The cleaner of claim 9, wherein a plurality of spacers (352) is spaced apart from each other on the connector body (351), and  
the reinforcing rib (354) connects one of the spacers (352) and the coupling hook (357) to each other.

11. The cleaner of claim 7, wherein any one of the first PCB (342) and the second PCB (344) includes a light emitting unit (370) for emitting light, and  
the connector body (351) includes one or more light holes (355) for passing the light from the light emitting unit (370).

12. The cleaner of claim 11, further comprising a PCB cover (360) that covers the main PCB (340) and the PCB connector (350),  
wherein the PCB cover (360) includes a light transmissive portion (364) through which the light passed through the one or more light holes (355) passes.

13. The cleaner of claim 12, wherein the PCB cover (360) includes a top portion (361) covering the PCB connector (350) and a pair of side portions (362, 363) extending downward from both sides of the top portion (361), and  
the pair of side portions (362, 363) covers sides of the PCB connector (350), a portion of the first PCB (342), and a portion of the second PCB (344).

14. The cleaner of claim 3, further comprising:

an operation unit (390) disposed on the handle unit (3); and  
a power PCB (380) connected with the main PCB (340) and receives operation instructions from the operation unit (390),  
wherein the handle body (332) includes a support rib (326) for supporting the power PCB (380)

at an angle.

15. The cleaner of claim 14, wherein the power PCB (380) is fixed to the handle body (332) at the same height as the main PCB (340), or wherein the main PCB (340) supports the power PCB (380) seated on the support rib (326).

## 10 Patentansprüche

1. Staubsauger, der aufweist:

einen Saugmotor (20), der Saugkraft erzeugt;  
eine Saugereinheit (5), die Luft und Staub führt, die durch die vom Saugmotor (20) erzeugte Saugkraft angesaugt werden;  
eine Staubabscheideeinheit, die Staub aus der Luft abscheidet, die durch die Saugereinheit (5) geführt wird;  
eine Haupt-Leiterplatte PCB (340), die Steuerungssignale für den Saugmotor (20) erzeugt und eine erste PCB (342) sowie eine zweite PCB (344) aufweist, die voneinander beabstandet sind;  
eine Griffereinheit (3), die die Haupt-PCB (340) aufnimmt; und  
einen PCB-Verbinder (350), der die erste PCB (342) und die zweite PCB (344) miteinander verbindet und mit der Griffereinheit (3) gekoppelt ist.

2. Staubsauger nach Anspruch 1, wobei der PCB-Verbinder (350) einen Koppelhaken (357) zum Koppeln der Griffereinheit (3) aufweist.

3. Staubsauger nach Anspruch 2, wobei die Griffereinheit (3) einen Griffkörper (332) aufweist und  
der Griffkörper (332) einen Raum (322) zum Aufnehmen der Haupt-PCB (340) und des PCB-Verbinders (350) sowie einen Verbinder-Koppelabschnitt (325) zum Koppeln des Koppelhakens (357) des PCB-Verbinders (350) im Raum (322) aufweist.

4. Staubsauger nach Anspruch 3, wobei, wenn die erste PCB (342) und die zweite PCB (344) mit dem PCB-Verbinder (350) verbunden sind, die erste PCB (342) und die zweite PCB (344) parallel zueinander angeordnet sind.

5. Staubsauger nach Anspruch 3, wobei der Koppelhaken (357) des PCB-Verbinders (350) mit dem Verbinder-Koppelabschnitt (325) so gekoppelt ist, dass die erste PCB (342) und die zweite PCB (344) aufrecht stehen.

6. Staubsauger nach Anspruch 3, wobei der Griffkörper (332) ferner eine Stütze (324) zum Stützen der Haupt-PCB (340) im Raum (322) aufweist und  
die Stütze (324) aufweist: einen Sitz (324a), auf dem

die Haupt-PCB (340) sitzt, eine erste Rippe (324b), die die erste PCB (342) auf dem Sitz (234a) stützt, und eine zweite Rippe (324c), die die zweite PCB (344) auf dem Sitz (324a) stützt.

7. Staubsauger nach Anspruch 2, wobei der PCB-Verbinder (350) aufweist:

einen Verbinderkörper (351), der den Koppelhaken (357) aufweist;  
einen Abstandhalter (352), der sich vom Verbinderkörper (351) erstreckt; und  
Koppelvorsprünge (353), die von beiden Seiten des Abstandhalters vorstehen, um die erste PCB (342) und die zweite PCB (344) zu koppeln.

8. Staubsauger nach Anspruch 7, wobei, wenn die erste PCB (342) und die zweite PCB (344) mit den Koppelvorsprüngen (353) auf beiden Seiten des Abstandhalters (352) gekoppelt sind, der Verbinderkörper (351) auf den Oberseiten der ersten PCB (342) und der zweiten PCB (344) sitzt.

9. Staubsauger nach Anspruch 7, wobei der Verbinderkörper (351) eine Verstärkungsrippe (354) zum Verhindern von Beschädigung des Koppelhakens (357) aufweist.

10. Staubsauger nach Anspruch 9, wobei mehrere Abstandhalter (352) auf dem Verbinderkörper (351) voneinander beabstandet sind, und die Verstärkungsrippe (354) einen der Abstandhalter (352) und den Koppelhaken (357) miteinander verbindet.

11. Staubsauger nach Anspruch 7, wobei die erste PCB (342) oder die zweite PCB (344) eine lichtemittierende Einheit (370) zum Emittieren von Licht aufweist, und der Verbinderkörper (351) ein oder mehrere Lichtlöcher (355) zum Durchleiten des Lichts von der lichtemittierenden Einheit (370) aufweist.

12. Staubsauger nach Anspruch 11, der ferner eine PCB-Abdeckung (360) aufweist, die die Haupt-PCB (340) und den PCB-Verbinder (350) abdeckt, wobei die PCB-Abdeckung (360) einen lichtdurchlässigen Abschnitt (364) aufweist, durch den das Licht hindurchfällt, das das eine oder die mehreren Lichtlöcher passiert hat.

13. Staubsauger nach Anspruch 12, wobei die PCB-Abdeckung (360) einen oberen Abschnitt (361), der den PCB-Verbinder (350) abdeckt, und ein Paar Seitenabschnitte (362, 363) aufweist, die sich von beiden Seiten des oberen Abschnitts (361) nach unten erstrecken, und das Paar Seitenabschnitte (362, 363) Seiten des PCB-Verbinders (350), einen Abschnitt der ersten

PCB (342) und einen Abschnitt der zweiten PCB (344) abdeckt.

14. Staubsauger nach Anspruch 3, der ferner aufweist:

eine Bedieneinheit (390), die auf der Griffereinheit (3) angeordnet ist; und  
eine Leistungs-PCB (380), die mit der Haupt-PCB (340) verbunden ist und Bedienbefehle von der Bedieneinheit (390) empfängt, wobei der Griffkörper (332) eine Stützrippe (326) zum Stützen der Leistungs-PCB (380) in einem Winkel aufweist.

15. Staubsauger nach Anspruch 14, wobei die Leistungs-PCB (380) am Griffkörper (332) in der gleichen Höhe wie die Haupt-PCB (340) befestigt ist oder wobei die Haupt-PCB (340) die Leistungs-PCB (380) stützt, die auf der Stützrippe (326) sitzt.

## Revendications

1. Aspirateur comprenant :

un moteur d'aspiration (20) qui génère une force d'aspiration ;  
une unité d'aspiration (5) qui guide de l'air et de la poussière aspirés par la force d'aspiration générée par le moteur d'aspiration (20) ;  
une unité de séparation de poussière qui sépare la poussière de l'air guidé à travers l'unité d'aspiration (5) ;  
une carte de circuit imprimé principale, PCB (340), qui génère des signaux de commande pour le moteur d'aspiration (20) et inclut une première carte de circuit imprimé (342) et une seconde carte de circuit imprimé (344) espacées l'une de l'autre ;  
une unité de poignée (3) qui reçoit la carte de circuit imprimé principale (340) ; et  
un raccord de carte de circuit imprimé (350) qui raccorde la première carte de circuit imprimé (342) et la seconde carte de circuit imprimé (344) l'une à l'autre et est couplé à l'unité de poignée (3).

2. Aspirateur selon la revendication 1, dans lequel le raccord de carte de circuit imprimé (350) inclut un crochet de couplage (357) destiné à coupler l'unité de poignée (3).

3. Aspirateur selon la revendication 2, dans lequel l'unité de poignée (3) inclut un corps de poignée (332), et le corps de poignée (332) inclut un espace (322) destiné à recevoir la carte de circuit imprimé principale (340) et le raccord de la carte de circuit imprimé (350), et une partie de couplage de raccord (325)

destinée à coupler le crochet de couplage (357) du raccord de carte de circuit imprimé (350) dans l'espace (322).

4. Aspirateur selon la revendication 3, dans lequel lorsque la première carte de circuit imprimé (342) et la seconde carte de circuit imprimé (344) sont raccordées au raccord de carte de circuit imprimé (350), la première carte de circuit imprimé (342) et la seconde carte de circuit imprimé (344) sont agencées en parallèle l'une à l'autre. 5
5. Aspirateur selon la revendication 3, dans lequel le crochet de couplage (357) du raccord de carte de circuit imprimé (350) est couplé à la partie de couplage de raccord (325), avec la première carte de circuit imprimé (342) et la seconde carte de circuit imprimé (344) érigées. 10
6. Aspirateur selon la revendication 3, dans lequel le corps de poignée (332) inclut en outre un support (324) destiné à supporter la carte de circuit imprimé principale (340) dans l'espace (322), et le support (324) inclut un siège (324a) sur lequel la carte de circuit imprimé principale (340) est placée, une première nervure (324b) qui supporte la première carte de circuit imprimé (342) sur le siège (324a), et une seconde nervure (324c) qui supporte la seconde carte de circuit imprimé (344) sur le siège (324a). 15
7. Aspirateur selon la revendication 2, dans lequel le raccord de carte de circuit imprimé (350) comprend : 20
  - un corps de raccord (351) qui a le crochet de couplage (357) ;
  - un espaceur (352) qui s'étend depuis le corps de raccord (351) ; et
  - des saillies de couplage (353) qui font saillie depuis les deux côtés de l'espaceur pour coupler la première carte de circuit imprimé (342) et la seconde carte de circuit imprimé (344). 25
8. Aspirateur selon la revendication 7, dans lequel lorsque la première carte de circuit imprimé (342) et la seconde carte de circuit imprimé (344) sont couplées aux saillies de couplage (353) sur les deux côtés de l'espaceur (352), le corps de raccord (351) est placé sur les parties supérieures de la première carte de circuit imprimé (342) et de la seconde carte de circuit imprimé (344). 30
9. Aspirateur selon la revendication 7, dans lequel le corps de raccord (351) inclut une nervure de renforcement (354) destinée à prévenir le dommage du crochet de couplage (357). 35
10. Aspirateur selon la revendication 9, dans lequel une 40

pluralité d'espaceurs (352) sont espacés les uns des autres sur le corps de raccord (351), et la nervure de renforcement (354) raccorde un parmi les espaceurs (352) et le crochet de couplage (357) l'un à l'autre.

11. Aspirateur selon la revendication 7, dans lequel une quelconque parmi la première carte de circuit imprimé (342) et la seconde carte de circuit imprimé (344) inclut une unité d'émission de lumière (370) destinée à émettre de la lumière, et le corps de raccord (351) inclut un ou plusieurs trous de lumière (355) destinés à faire passer la lumière provenant de l'unité d'émission de lumière (370). 45
12. Aspirateur selon la revendication 11, comprenant en outre une couverture de carte de circuit imprimé (360) qui recouvre la carte de circuit imprimé principale (340) et le raccord de carte de circuit imprimé (350), dans lequel la couverture de carte de circuit imprimé (360) inclut une partie de transmission de lumière (364) à travers laquelle la lumière passant à travers les un ou plusieurs trous de lumière (355) passe. 50
13. Aspirateur selon la revendication 12, dans lequel la couverture de carte de circuit imprimé (360) inclut une partie supérieure (361) recouvrant le raccord de carte de circuit imprimé (350) et une paire de parties latérales (362, 363) s'étendant vers le bas depuis les deux côtés de la partie supérieure (361), et la paire de parties latérales (362, 363) recouvre les côtés du raccord de carte de circuit imprimé (350), une partie de la première de carte de circuit imprimé (342) et une partie de la seconde carte de circuit imprimé (344). 55
14. Aspirateur selon la revendication 3, comprenant en outre :
  - une unité de fonctionnement (390) disposée sur l'unité de poignée (3) ; et
  - une carte de circuit imprimé de puissance (380) raccordée à la carte de circuit imprimé principale (340) et reçoit des instructions de fonctionnement à partir de l'unité de fonctionnement (390), dans lequel le corps de poignée (332) inclut une nervure de support (326) destinée à supporter la carte de circuit imprimé de puissance (380) à un angle.
15. Aspirateur selon la revendication 14, dans lequel la carte de circuit imprimé de puissance (380) est fixée au corps de poignée (332) à la même hauteur que la carte de circuit imprimé principale (340), ou dans lequel la carte de circuit imprimé principale (340) supporte la carte de circuit imprimé de puissance (380) placée sur la nervure de support (326).
