Note: Within nine months of the publication of the mention of the grant of the European patent in the European Patent Bulletin, any person may give notice to the European Patent Office of opposition to that patent, in accordance with the Implementing Regulations. Notice of opposition shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

Description**Field of the Invention**

[0001] The present invention generally relates to a process for the preparation of a product, the product being 6-methyl-3,4-dihydro-1,2,3-oxathiazin-4-one 2,2-dioxide or a salt thereof. The present invention also relates to the use of such a process for making diammonium sulphate.

Background

[0002] Acesulfame and its derivatives are hugely important as sweeteners in food stuffs and in medicines. Of particular interest are the non-toxic salts, of which the potassium salt acesulfame K is most noteworthy. Acesulfame K is often marketed under the tradenames Sunett® and Sweet one® and is designated with the E number E950 in the European Union. In view of the huge demand for acesulfame as a sweetener, around twenty thousand metric tonnes per annum globally, there is a great need for improved processes for its production and even minor improvements to the production processes can result in huge savings, both economically and ecologically.

[0003] Early approaches to acesulfame production employed halogen based intermediates. A number of examples are presented in Angewandte Chemie 85, No. 22 (1973), pages 965 to 73, corresponding to International Edition Vol. 12, No. 11 (1973), pages 869-76. There, the processes overwhelmingly start from chlorosulphonyl or fluorosulphonyl isocyanate. Another example is given in German patent publication number 2,453,063 where a process starting from amido-sulphonyl fluoride is disclosed.

[0004] A process for the preparation of acesulfame which proceeds via an acetoacetamide-N-sulphonic acid can offer the advantage of starting from more readily accessible starting materials. One example of such a process is presented in Chinese patent application 201310531442.

[0005] European patent document EP 2 560 919 B2 describes a process for preparing diammonium sulphate.

[0006] European patent application EP 1 564 211 A1 describes a preparation of a 3,4-dihydro-1,2,3-oxathiazin-4-one-2,2-dioxide compound from a beta-ketoamide-N-sulfonic acid and acid anhydride in a continuous flow reactor.

[0007] US patent application US 2009/0318685 A1 describes a preparation of a 3,4-dihydro-1,2,3-oxathiazin-4-one-2,2-dioxide compound from beta-ketoamide-N-sulfonic acid and acid anhydride in an inert solvent with a hydrolysis step and a washing step.

[0008] International patent application WO 2011/133468 A1 describes a process for producing ammonium salts from a process stream.

[0009] There remains however a need for improved processes for the preparation of acesulfame, in particular with sulphuric acid removal.

Summary of the Invention

[0010] Generally, it is an object of the present invention to at least partly overcome a disadvantage arising from the prior art.

[0011] It is an object of the invention to provide a process for the preparation of acesulfame or a derivative thereof with a reduced energy consumption.

[0012] It is an object of the invention to provide a process for the preparation of acesulfame or a derivative thereof in which the conversion of spent sulphuric acid into diammonium sulphate has a reduced energy consumption.

[0013] It is an object of the invention to provide a process for the preparation of acesulfame or a derivative thereof with a reduced energy consumption in two or more process steps.

[0014] It is an object of the invention to provide a process for the preparation of acesulfame or a derivative thereof which has a reduced environmental impact.

Detailed description

[0015] Throughout this document, a hydrolysis step is also referred to as a step of contacting with H₂O.

[0016] 6-methyl-3,4-dihydro-1,2,3-oxathiazin-4-one 2,2-dioxide is also called acesulfame and the term acesulfame is used throughout this document as a synonym of 6-methyl-3,4-dihydro-1,2,3-oxathiazin-4-one 2,2-dioxide.

[0017] A contribution to achieving at least one of the above objects is made by the claims. A contribution to achieving at least one of the above objects is made by the following embodiments, the number of the embodiment being indicated between vertical bars.

[1] A process for the preparation of a product, the product being 6-methyl-3,4-di-hydro-1,2,3-oxathiazin-4-one 2,2-

dioxide or a salt thereof, the process comprising the following steps:

- a. Contacting SO_3 and acetoacetamide-N-sulphonic acid or a salt thereof in the presence of an amine, thereby obtaining a first stream comprising the amine and sulphuric acid;
- b. Providing a second stream comprising ammonia;
- c. Providing a circuit;
- d. Introducing the second stream into the circuit at point A and the first stream into the circuit at point B to obtain a cycle stream cycling in the circuit;
- e. Removing a portion of the cycle stream at a point C to obtain a third stream;

wherein the circulation ratio is in the range from 3 to 30, preferably in the range from 4 to 20, more preferably in the range from 5 to 15, more preferably in the range from 6 to 12, more preferably in the range from 8 to 11, the circulation ratio being the value of the mass flow rate of the cycle stream immediately preceding point A F_c divided by the value of the mass flow rate of the first stream into the circuit at point B F_1 according to the following formula:

$$\text{circulation ratio} = F_c/F_1$$

[0018] In one aspect of this embodiment, the first stream satisfies one or more of the following criteria:

- i.) The content of sulphuric acid is in the range from 35 to 75 wt. %, preferably in the range from 45 to 65 wt. %, most preferably in the range from 50 to 60 wt. %;
- ii.) The content of the amine is in the range from 5 to 25 wt. %, preferably in the range from 8 to 20 wt. %, most preferably in the range from 10 to 15 wt. %.
- iii.) The content of H_2O is in the range from 10 to 60 wt. %, preferably in the range from 20 to 50 wt. %, most preferably in the range from 25 to 40 wt. %.
- iv.) The first stream does not contain more than 1 wt. % dichloromethane, preferably not more than 0.5 wt. %, more preferably not more than 0.1 wt. %, more preferably not more than 0.05 wt. %.

[0019] In one aspect of this embodiment, the second stream satisfies one or more of the following criteria:

- i.) The content of ammonia is in the range from 90 to 100 wt. %, preferably in the range from 95 to 100 wt. %, most preferably in the range from 99 to 100 wt. %;
- ii.) The content of H_2O is in the range from 0 to 10 wt. %, preferably in the range from 0 to 5 wt. %, most preferably in the range from 0 to 1 wt. %.

[0020] In one aspect of this embodiment, the third stream satisfies one or more of the following criteria:

- i.) The content of H_2O is in the range from 10 to 45 wt. %, preferably in the range from 15 to 35 wt. %, most preferably in the range from 20 to 30 wt. %;
- ii.) The content of diammonium sulphate is in the range from 20 to 85 wt. %, preferably in the range from 25 to 75 wt. %, most preferably in the range from 40 to 70 wt. %;
- iii.) The content of the amine is in the range from 5 to 30 wt. %, preferably in the range from 10 to 25 wt. %, most preferably in the range from 8 to 20 wt. %.

[2] The process according to embodiment [1], wherein the amine is triethyl amine.

[3] The process according to embodiment [1] or [12], wherein the third stream is removed from the cycle stream at a point C and the points A, B & C are ordered in the direction of the flow of the cycle stream in the circuit.

[4] The process according to any of the preceding embodiments, wherein the second stream does not comprise more than 50 wt. % H_2O , preferably not more than 40 wt. %, more preferably not more than 30 wt. %, more preferably not more than 20 wt. %, more preferably not more than 10 wt. %, more preferably not more than 5 wt. %, more preferably not more than 2 wt. %, more preferably not more than 1 wt. %. Most preferably the second stream is free of H_2O .

[5] The process according to any of the preceding embodiments, wherein the second stream is a liquid.

[6] The process according to any of the preceding embodiments, wherein the second stream is at a pressure in the range from 0.2 to 1.5 MPa, preferably in the range from 0.25 to 1.4 MPa, more preferably in the range from 0.3 to 1.3 MPa.

[7] The process according to any of the preceding embodiments, further comprising the following step:
f. Separating the third stream to obtain a fourth stream comprising the amine and a fifth stream comprising diammonium sulphate;

wherein the fourth stream comprises a higher wt. % of the amine than the first stream;

wherein the fourth stream comprises a lower wt. % of diammonium sulphate than the first stream, wherein the separation is made by phase separation into a liquid and a gas phase.

[0021] The separation step f. is preferably a phase separation, preferably into a volatile phase and a liquid. The fourth stream is preferably a volatile phase. The fifth stream is preferably a liquid. A preferred volatile phase is a gas. Preferably, the volatile phase is an azeotrope.

[0022] In one aspect of this embodiment, the fourth stream satisfies the following criterion:

i.) The content of the amine is in the range from 60 to 95 wt. %, preferably in the range from 65 to 90 wt. %, more preferably in the range from 70 to 80 wt. %.

[0023] In one aspect of this embodiment, the fifth stream satisfies the following criterion:

i.) The content of diammonium sulphate is in the range from 30 to 85 wt. %, preferably in the range from 35 to 80 wt. %, more preferably in the range from 45 to 75 wt. %.

[8] The process according to embodiment [7], wherein the fifth stream is contacted with H₂O in a step g₁.

[9] The process according to embodiment [8], wherein least part of the H₂O is present in step g₁ in a gaseous state, preferably all the H₂O.

[10] The process according to any of the embodiments [7] to [9], wherein the mass ratio of the fourth stream to the fifth stream is in the range from 30:70 to 1:99, more preferably in the range from 20:80 to 2:98, more preferably in the range from 15:85 to 5:95.

[11] The process according to any of the embodiments [7] to [10], wherein the content of H₂O in the fifth stream is reduced in a step g₂, wherein the step g₂ is a solidification. In one aspect of this embodiment, some H₂O remains in the fifth stream following step g₂. In another aspect of this embodiment, the content of H₂O in the fifth stream is reduced to substantially none.

[12] The process according to embodiment [11], wherein the step g₂ is a solidification. Preferred solidifications are one or more selected from the group consisting of: a crystallisation, a precipitation and a drying.

[13] The process according to any of the embodiments [7] to [12], wherein the fourth stream is separated into a sixth stream and a seventh stream in a step h;

wherein the seventh stream comprises more H₂O than the sixth stream;

wherein the sixth stream comprises more of the amine than the seventh stream,

[14] wherein the step h is a distillation.

[15] The process according to any of the preceding embodiments, wherein the cycle stream is heated or cooled, preferably by a heat exchanger. The heat exchanger is preferably an active heat exchanger. Heat extracted from the cycle stream may be used for stripping sulphuric acid fed into the reaction as the first stream.

[16] A use of the process according to any of the preceding embodiments for making diammonium sulphate.

Process

[0024] A contribution to achieving at least one of the above mentioned objects is made by a process for the preparation of a product, the product being 6-methyl-3,4-dihydro1,2,3-oxathiazin-4-one 2,2-dioxide or a salts thereof, the process comprising the following steps:

- Contacting SO_3 and acetoacetamide-N-sulphonic acid or a salt thereof in the presence of an amine, thereby obtaining a first stream comprising the amine and sulphuric acid;
- Providing a second stream comprising ammonia;
- Providing a circuit;
- Introducing the second stream into the circuit at point A and the first stream into the circuit at point B to obtain a cycle stream cycling in the circuit;
- Removing a portion of the cycle stream at a point C to obtain a third stream;

Contacting step a. & Acesulfame production

[0025] Contacting step a. preferably produces an acesulfame.

[0026] In one embodiment, the contacting step a. may constitute a series of chemical reactions such as that presented in the following chemical equation I:

I

[0027] In other embodiments, the process may comprise a series of chemical reactions similar to those presented in chemical equation I. In one aspect of this embodiment, a solvent other than CH_2Cl_2 is employed, preferably one selected from the solvents section below. In one aspect of this embodiment, a base different to KOH is employed and the resulting acesulfame has a correspondingly different cation. In one aspect of this embodiment, an amine different to triethyl amine is employed. In one aspect of this embodiment, an equimolar amount of SO_3 is employed, namely the parameter n is set to 1. Here, the formula $(n-1)$ is equal to zero and no H_2O is employed.

[0028] The process of the invention preferably includes a ring closure reaction in which the acetoacetamide-N-sulphonic acid or salt thereof reacts to form a ring. The ring closure is preferably assisted by the SO_3 .

[0029] In one embodiment of the process, a sub-step of contacting with H_2O is performed as part of step a.. A sub-step of contacting with H_2O is preferably employed for hydrolysing an adduct, preferably an adduct comprising SO_3 .

[0030] In one embodiment, a sub-step of neutralising with alkali is performed as part of step a. and preferably following the sub-step of contacting with H_2O were one is performed.

[0031] In one preferred embodiment, the contacting step a. may be carried out at least partially in a reactor, preferably a tubular reactor. In one aspect of this embodiment, the contacting step a. may be performed at elevated pressure or elevated temperature or both. In one aspect of this embodiment, the first stream exits the reactor as a spray.

[0032] In one embodiment, the contacting step a. is performed at a temperature in the range from -70 to 175°C , preferably in the range from 40 to 150°C , more preferably in the range from 60 to 130°C , most preferably in the range from 80 to 120°C .

[0033] In one embodiment, the contacting step a. is performed at a pressure in the range from 0.2 to 2 MPa, preferably in the range from 0.3 to 1.5 MPa, more preferably in the range from 0.4 to 1.2 MPa, most preferably in the range from 0.5 to 1 MPa.

[0034] In one embodiment, the molar ratio in step a. of the SO_3 to the acetoacetamide-N-sulphonic acid or salt thereof is in the range from $1:1$ to $20:1$, preferably in the range from $2:1$ to $17:1$, more preferably in the range from $2.5:1$ to $15:1$, most preferably in the range from $3:1$ to $10:1$.

[0035] The first stream is preferably derived from the product of the contacting in step a. by extracting acesulfame from sulphuric acid using a solvent, preferably with an extraction column. In one embodiment, acesulfame is extracted

from sulphuric acid using dichloro methane (DCM). In one aspect of this embodiment, the DCM is at least partially removed to obtain the first stream.

[0036] In one embodiment, a step of contacting with a solvent is performed in contacting step a. and preferably subsequently to the step of contacting with water if one is performed. Preferred solvents in this context are inert solvents. An inert solvent preferably does not react chemically with the acetoacetamide-N-sulphonic acid or salt thereof. An inert solvent preferably does not react chemically with acesulfame or a salt thereof. An inert solvent preferably reacts at most minimally with SO_3 , preferably not consuming more than 1 wt. % of the SO_3 in one hour, based on the amount of SO_3 . Preferred solvents for the acetoacetamide-N-sulphonic acid or salt thereof are one or more selected from the group consisting of the following: halogenated aliphatic hydrocarbons, aliphatic sulfoxides and aliphatic sulphones. Preferred halogenated aliphatic hydrocarbons have up to four carbon atoms, preferably one or more selected from the group consisting of the following: methylene chloride, chloroform and 1,2-dichloroethane. The preferred aliphatic sulfoxide is dimethyl sulfoxide. The preferred aliphatic sulphone is sulpholane. In one embodiment, the solvent for the acetoacetamide-N-sulphonic acid or salt thereof is one or more selected from the group consisting of the following: methylene chloride and 1,2-dichloroethane, preferably methylene chloride.

[0037] In one embodiment, step a. comprises a sub-step of at least partially removing a solvent from the sulphuric acid, preferably dichloromethane. The content of the solvent in the sulphuric acid, preferably the dichloromethane, is preferably reduced by heating.

[0038] The amine of step a. can be a monoalkyl amine, a dialkyl amine or a trialkyl amine, preferably a trialkyl amine. Preferred trialkyl amines are trimethyl amine, triethyl amine and tripropyl amine, preferably triethyl amine. Preferred monoalkyl amines are monomethyl amine, monoethyl amine and monopropyl amine, preferably monoethyl amine. Preferred dialkyl amines are dimethyl amine, diethyl amine and dipropyl amine, preferably diethyl amine. The preferred amine is triethyl amine.

Hydrolysis

[0039] Step a. may comprise a hydrolysis sub-step. A hydrolysis sub-step is preferably a sub-step of contacting the product of the reaction of step a. with H_2O . Throughout this document, a hydrolysis sub-step may be termed as such or as a sub-step of contacting with H_2O . A hydrolysis sub-step is particularly preferred where the product of the reaction in step a. is an adduct, preferably an adduct with SO_3 . Where a hydrolysis is performed, a separation sub-step is preferably also performed for removing a hydrolysis product, preferably for removing sulphuric acid.

[0040] The sub-step of contacting with H_2O preferably produces a mixture comprising acesulfame or a salt thereof, sulphuric acid and H_2O . The amount of H_2O employed in the sub-step of contacting with H_2O is preferably selected such that the resulting mixture comprises a weight ratio of sulphuric acid: H_2O in the range from 1:10 to 10:1, preferably in the range from 1:3 to 5:1, more preferably in the range from 1:1 to 3:1. In one embodiment, the sub-step of contacting with H_2O is performed as a continuous process. In this embodiment, the ratio of sulphuric acid to H_2O is set by adapting a flow rate of H_2O .

[0041] In one embodiment, the H_2O for the hydrolysis sub-step is in a vapour phase. In one embodiment, the H_2O for the hydrolysis sub-step is in a liquid phase. In one embodiment, the H_2O for the hydrolysis sub-step comprises a vapour phase and a liquid phase.

Reactor

[0042] The contacting step a. is preferably carried out in a reactor. The reactor is preferably configured and adapted to withstand elevated pressure and elevated temperature. In one embodiment, the reactor is configured and adapted to withstand the temperatures employed for the contacting step a.. In another embodiment, the reactor is configured and adapted to withstand temperatures up to 140 °C, preferably 175 °C, more preferably up to 200 °C. In one embodiment, the reactor is configured and adapted to withstand the pressures employed for the contacting step a.. In another embodiment, the reactor is configured and adapted to withstand pressures up to 1.6 MPa, preferably up to 2.5 MPa, more preferably up to 3.2 MPa.

[0043] In one embodiment, the reactor is a tubular reactor, preferably a cylindrical tubular reactor. In one embodiment, the reactor comprises a tube, preferably a cylindrical tube. The interior of a tube or of a tubular reactor is also referred to as a bore. The tube is preferably adapted and configured to result in a pressure drop between the reactor and outside the reactor, preferably a pressure drop of more than 0.05 MPa. A preferred tube is adapted and configured to cause spraying of the product.

[0044] The reactor preferably contains a mixer, preferably a static mixer.

Contacting the first and the second stream

[0045] The first stream and the second stream are contacted in the circuit. The first stream comprises sulphuric acid and the second stream comprises ammonia. The contacting preferably produces diammonium sulphate. The first stream and the second stream are not contacted directly, rather each is introduced into the cycle stream, wherein they react.

[0046] Reaction between sulphuric acid and ammonia is exothermic. The reaction heat preferably serves to provide sufficient reaction temperature to the starting materials and for volatilising a fourth stream. A part or all of the third stream may be used as heating medium to strip the spent sulphuric acid before it enters the reaction as first stream. Thus, the heat of reaction reduces the energy consumption of the stripping step.

[0047] The cycle stream may be heated or cooled, in particular for adapting the rate of volatilisation from the third stream.

Step f. - Separation of the third stream

[0048] In the separation step f., the third stream is separated into a fourth stream and a fifth stream. The fourth stream preferably comprises H_2O and the amine, preferably as an azeotrope. The fourth stream is preferably a volatile phase. A preferred volatile phase is a gas. Preferably, the volatile phase is an azeotrope. The fourth stream can subsequently be split in order to recover the amine. The fifth stream preferably comprises H_2O and diammonium sulphate. The fifth stream is preferably a liquid. The fifth stream can subsequently be treated with H_2O , preferably steam. The fifth stream can subsequently have H_2O removed, preferably to solidify diammonium sulphate.

[0049] The separation of the third stream into the fourth stream and the fifth stream is preferably a phase separation, preferably with the fourth stream being a volatile phase and the fifth stream being a liquid. A preferred volatile phase is a gas. Preferably, the volatile phase is an azeotrope.

[0050] The separation step f. is preferably performed in a separator, preferably a phase separator. Another term for a separator is a splitter.

Step g_1 - contacting of the fifth stream with H_2O

[0051] The fifth stream may be contacted with H_2O in a step g_1 preferably to obtain an aqueous solution of diammonium sulphate. Contacting with H_2O preferably reduces the content of the amine in the fifth stream. Amine removed from the fifth stream in step g_1 may be introduced into the fourth stream.

Step g_2 - reduction of H_2O content

[0052] The fifth stream may be treated to reduce its content of H_2O in a step g_2 . Step g_2 is preferably a solidification step. Reduction of content of H_2O , preferably solidification, is preferably effected by spray drying, preferably with heated gas, preferably air. Preferred solidifications are one or more selected from the following: a crystallisation, a precipitation and a drying. A crystallisation can be used to reduce the content of a material in the fifth stream other than diammonium sulphate or H_2O .

Step h - separation of the amine and H_2O

[0053] The fourth stream may be separated into a sixth stream and a seventh stream, wherein the seventh stream comprises more H_2O than the sixth stream and wherein the sixth stream comprises more of the amine than the seventh stream. The separation of step h is preferably a phase separation and a distillation. The amine content of the sixth stream can be collected at the bottom of a distillation apparatus.

 SO_3

[0054] A contribution to achieving at least one of the above mentioned objects is made by a process in which SO_3 is employed as a starting material. SO_3 is preferably employed in an amount by mols which is at least equal to the amount by mols of the acetoacetamide-N-sulphonic acid or a salt thereof, preferably with the molar ratio in step a. of the SO_3 to the acetoacetamide-N-sulphonic acid or salt thereof being in the range from 1:1 to 20:1, preferably in the range from 2:1 to 17:1, more preferably in the range from 2.5:1 to 15:1, most preferably in the range from 3:1 to 10:1. In one embodiment, SO_3 is employed in an approximately equimolar amount to the acetoacetamide-N-sulphonic acid or a salt thereof. In this case, it can be that insufficient SO_3 is present for forming an adduct. In one aspect of this embodiment no step of contacting with H_2O is required. In one embodiment, a molar excess of SO_3 is employed, preferably with the molar ratio in step a. of the SO_3 to the acetoacetamide-N-sulphonic acid or salt thereof being in the range from greater than 1:1 to 20:1, preferably in the range from 2:1 to 17:1, more preferably in the range from 2.5:1 to 15:1, most preferably

in the range from 3:1 to 10:1.

[0055] In one embodiment of the invention, SO₃ is provided in step a. in a first solvent.

[0056] In another embodiment, SO₃ is provided in step a. as a liquid.

5 Acetoacetamide-N-sulphonic acid or a salt thereof

[0057] Acetoacetamide-N-sulphonic acid or a salt thereof is employed in the process according to the invention. Acetoacetamide-N-sulphonic acid is also known by its chemical formula CH₃COCH₂CONHSO₃H and the term Acetoacetamide-N-sulphonic acid and the formula CH₃COCH₂CONHSO₃H shall be used interchangeably in this document.

10 **[0058]** Preferred derivatives of Acetoacetamide-N-sulphonic acid are salts, preferably having the formula CH₃COCH₂CONHSO₃⁻M⁺. A preferred M⁺ is selected from the group consisting of Na⁺, K⁺, Ca²⁺, Li⁺, ammonium and an aliphatic ammonium. Preferred aliphatic ammoniums in this context are one or more selected from the group consisting of: monoethyl ammonium, diethyl ammonium, triethyl ammonium, methyl ammonium, dimethyl ammonium and tri methyl ammonium. The preferred aliphatic ammonium is triethyl ammonium.

15 **[0059]** The Acetoacetamide-N-sulphonic acid or salt thereof might be procured or formed in a process preceding step a. of the process of the invention. On preferred route for forming Acetoacetamide-N-sulphonic acid or a salt thereof is by reacting amidosulphonic acid or a salt thereof with an acetoacetylating agent, preferably in approximately equimolar amounts. Preferred derivatives of amidosulphonic acid in this contexts are salts, preferably with a cation selected from the group consisting of Na⁺, K⁺, Ca²⁺, Li⁺, ammonium and an aliphatic ammonium. Preferred aliphatic ammoniums in this context are one or more selected from the group consisting of: monoethyl ammonium, diethyl ammonium, triethyl ammonium, methyl ammonium, dimethyl ammonium and tri methyl ammonium. The preferred aliphatic ammonium is triethyl ammonium.

[0060] The preferred acetoacetylating agent is diketene.

25 **[0061]** In one embodiment, the acetoacetamide-N-sulphonic acid or salt thereof for the contacting step a. is provided in a second solvent.

Solvents

30 **[0062]** One or more solvents may be employed in the process of the invention, for example in one or more of the following roles: as a vehicle for the SO₃, as a vehicle for the acetoacetamide-N-sulphonic acid or salt thereof, as a reaction medium in the reactor or for providing evaporative cooling.

[0063] Preferred solvents for the acetoacetamide-N-sulphonic acid or salt thereof are inert solvents. An inert solvent preferably does not react chemically with the acetoacetamide-N-sulphonic acid or salt thereof. An inert solvent preferably does not react chemically with acesulfame or a salt thereof. An inert solvent preferably reacts at most minimally with SO₃, preferably not consuming more than 1 wt. % of the SO₃ in one hour, based on the amount of SO₃. Preferred solvents for the acetoacetamide-N-sulphonic acid or salt thereof are one or more selected from the group consisting of the following: halogenated aliphatic hydrocarbons, aliphatic sulfoxides and aliphatic sulphones. Preferred halogenated aliphatic hydrocarbons have up to four carbon atoms, preferably one or more selected from the group consisting of the following: methylene chloride, chloroform and 1,2-dichloroethane. The preferred aliphatic sulfoxide is dimethyl sulfoxide. The preferred aliphatic sulphone is sulfolane. In one embodiment, the solvent for the acetoacetamide-N-sulphonic acid or salt thereof is one or more selected from the group consisting of the following: methylene chloride and 1,2-dichloroethane, preferably methylene chloride.

[0064] Preferred solvents for the SO₃ are inert solvents. An inert solvent preferably does not react chemically with the acetoacetamide-N-sulphonic acid or salt thereof. An inert solvent preferably does not react chemically with acesulfame or a salt thereof. An inert solvent preferably reacts at most minimally with SO₃, preferably not consuming more than 1 wt. % of the SO₃ in one hour, based on the amount of SO₃. Preferred solvents for the SO₃ may be inorganic solvents or organic solvents or both. The preferred inorganic solvent is SO₂. Preferred organic solvents are one or more selected from the group consisting of the following: halogenated aliphatic hydrocarbons, aliphatic sulphones. Preferred halogenated aliphatic hydrocarbons have up to four carbon atoms, preferably one or more selected from the group consisting of the following: methylene chloride, chloroform and 1,2-dichloroethane. The preferred aliphatic sulphone is sulfolane. In one embodiment, the solvent is SO₂ or methylene chloride or both.

[0065] In a preferred embodiment of the process according to the invention the same solvent is used both for the acetoacetamide-N-sulphonic acid or salt thereof and for the SO₃. Preferred solvents in this context are halogenated aliphatic hydrocarbons, most preferably methylene chloride.

55 **[0066]** In one embodiment, the contacting in step a. is performed in the presence of a reaction solvent. In one aspect of this embodiment, the reaction solvent is a chemical compound. In another aspect of this embodiment, the reaction solvent is two or more chemical compounds. In one aspect of this embodiment, the reaction solvent is an inert solvent. An inert solvent preferably does not react chemically with the acetoacetamide-N-sulphonic acid or salt thereof. An inert

solvent preferably does not react chemically with acesulfame or a salt thereof. An inert solvent preferably reacts at most minimally with SO_3 , preferably not consuming more than 1 wt. % of the SO_3 in one hour, based on the amount of SO_3 . In one aspect of this embodiment, the reaction solvent comprises a halogenated hydrocarbon. In one aspect of this embodiment, the reaction solvent is a halogenated hydrocarbon. In one aspect of this embodiment, the reaction solvent comprises dichloromethane. In one aspect of this embodiment, the reaction solvent is dichloromethane.

[0067] In one embodiment, the SO_3 for the contacting step a. is provided in a first solvent. In one aspect of this embodiment, the first solvent is a chemical compound. In another aspect of this embodiment, the first solvent is two or more chemical compounds. In one aspect of this embodiment, the first solvent is an inert solvent. An inert solvent preferably does not react chemically with the acetoacetamide-N-sulphonic acid or salt thereof. An inert solvent preferably does not react chemically with acesulfame or a salt thereof. An inert solvent preferably reacts at most minimally with SO_3 , preferably not consuming more than 1 wt. % of the SO_3 in one hour, based on the amount of SO_3 . In one aspect of this embodiment, the first solvent comprises a halogenated hydrocarbon. In one aspect of this embodiment, the first solvent is a halogenated hydrocarbon. In one aspect of this embodiment, the first solvent comprises dichloromethane. In one aspect of this embodiment, the first solvent is dichloromethane. In one aspect of this embodiment, the concentration of SO_3 in the first solvent is in the range from 0.05 to 20 molar, preferably in the range from 0.1 to 15 molar, more preferably in the range from 0.15 to 10 molar, most preferably in the range from 0.2 to 6 molar.

[0068] In one embodiment, the acetoacetamide-N-sulphonic acid or a salt thereof for the contacting step a. is provided in a second solvent. In one aspect of this embodiment, the second solvent is a chemical compound. In another aspect of this embodiment, the second solvent is two or more chemical compounds. In one aspect of this embodiment, the second solvent is an inert solvent. An inert solvent preferably does not react chemically with the acetoacetamide-N-sulphonic acid or salt thereof. An inert solvent preferably does not react chemically with acesulfame or a salt thereof. An inert solvent preferably reacts at most minimally with SO_3 , preferably not consuming more than 1 wt. % of the SO_3 in one hour, based on the amount of SO_3 . In one aspect of this embodiment, the second solvent comprises a halogenated hydrocarbon. In one aspect of this embodiment, the second solvent is a halogenated hydrocarbon. In one aspect of this embodiment, the second solvent comprises dichloromethane. In one aspect of this embodiment, the second solvent is dichloromethane. In one aspect of this embodiment, the concentration of the acetoacetamide-N-sulphonic acid or a salt thereof in the second solvent is in the range from 0.02 to 5 molar, preferably in the range from 0.03 to 3 molar, more preferably in the range from 0.04 to 2 molar, most preferably in the range from 0.05 to 1.5 molar.

[0069] In one embodiment, the process according to any of the preceding embodiments, wherein the SO_3 for the contacting step a. is provided in a first solvent and the acetoacetamide-N-sulphonic acid or a salt thereof for the contacting step a. is provided in a second solvent and the first solvent and the second solvent are the same. In one aspect of this embodiment, the first solvent is a chemical compound. In another aspect of this embodiment, the first solvent is two or more chemical compounds. In one aspect of this embodiment, the first solvent is an inert solvent. An inert solvent preferably does not react chemically with the acetoacetamide-N-sulphonic acid or salt thereof. An inert solvent preferably does not react chemically with acesulfame or a salt thereof. An inert solvent preferably reacts at most minimally with SO_3 , preferably not consuming more than 1 wt. % of the SO_3 in one hour, based on the amount of SO_3 . In one aspect of this embodiment, the first solvent comprises a halogenated hydrocarbon. In one aspect of this embodiment, the first solvent is a halogenated hydrocarbon. In one aspect of this embodiment, the first solvent comprises dichloromethane. In one aspect of this embodiment, the first solvent is dichloromethane.

Product

[0070] The process of the invention is preferably for the preparation of 6-methyl-3,4-dihydro1,2,3-oxathiazin-4-one 2,2-dioxide or a salt thereof. 6-methyl-3,4-dihydro1,2,3-oxathiazin-4-one 2,2-dioxide is also called acesulfame and the term acesulfame is used throughout this document as a synonym of 6-methyl-3,4-dihydro1,2,3-oxathiazin-4-one 2,2-dioxide.

[0071] The product of the present invention can be used as a food ingredient, preferably as a sweetener. Quite often, acesulfames are categorised as high intensity sweeteners. In one embodiment, the acesulfame or salt thereof is non-toxic. In one embodiment, the acesulfame or salt thereof can be hydrolysed, preferably at elevated temperature in acidic media, preferably resulting in non-toxic hydrolysis products.

[0072] Acesulfame is often prepared or usefully employed in the form of a salt. In one embodiment, the product is a salt of acesulfame. Preferred salts of acesulfame comprise the conjugate base of acesulfame and a cation. Preferred cations in this context are one or more selected from the group consisting of the following: Na^+ , K^+ , Ca^+ and aspartame, preferably K^+ . In one embodiment, the preferred cation is selected from the group consisting of Na^+ , K^+ and Ca^+ , preferably K^+ . In another embodiment, the cation is aspartame. The salt is preferably formed by removing the acidic hydrogen from the nitrogen atom of the acesulfame or salt thereof. The product of the present invention can be used as a food ingredient. In one embodiment, the acesulfame salt is non-toxic. In one embodiment, the acesulfame salt can be hydrolysed, preferably at elevated temperature in acidic media, preferably resulting in non-toxic hydrolysis products.

[0073] Acesulfame can be prepared in the form of an adduct, either as an end product or as an intermediate. In one embodiment, the product is an adduct comprising acesulfame or a salt thereof. Preferred adducts are formed with electron acceptors, also called Lewis acids. In one aspect of this embodiment, the preferred adduct is formed with SO₃. In one aspect of this embodiment, the product is an adduct of 6-methyl-3,4-dihydro-1,2,3-oxathiazin-4-one 2,2-dioxide with SO₃ also called acesulfame:SO₃ adduct. The acesulfame:SO₃ adduct may comprise 1 or more SO₃ entities. In one aspect the acesulfame:SO₃ adduct may comprise 1, 2, 3, 4, 5, 6, 7 or 8 SO₃ entities. In one aspect the acesulfame:SO₃ adduct may comprise 1 to 8 SO₃ entities, preferably 1 to 7, more preferably 1 to 6, more preferably still 1 to 5. The product of the present invention can be used as a food ingredient. In one embodiment, the adduct is non-toxic. In one embodiment, the adduct can be hydrolysed to obtain non-toxic hydrolysis products.

[0074] The product may be a mixture, preferably having one or more constituents selected from the group consisting of: acesulfame, an acesulfame adduct and any other derivative of acesulfame. In one embodiment, the product comprises compounds with differing degrees of adduction. In one aspect of this embodiment, the product comprises acesulfame and one or more acesulfame adducts, the adducts preferably being with SO₃.

Test Methods

[0075] The following test methods are used for features disclosed in this document. In the absence of a test method, the ISO test method for the feature to be measured published most recently before the earliest filing date of the present application applies. In the absence of measuring conditions, a temperature of 298.15 K (25 °C, 77 °F) and an absolute pressure of 100 kPa (14.504 psi, 0.986 atm) apply.

Detection of Chemical Species and Concentrations

[0076]

- Acesulfame content is determined by a combination of HPLC and UV spectroscopy according to the procedure described in "Monograph D acesulfame-K USP-NF" as published by "The United States Pharmacopeia and The National Formulary". The version of the monograph published most recently before the earliest filing or priority date of this document is employed.
- Acetoacetamide-N-sulphonic acid salt content is calculated based on the contents of the input streams to the process.
- SO₃ content is determined by distillation.
- The content of solvents is determined by gas chromatography and Karl Fisher titration.

[0077] The yield of acesulfame is calculated based on the input content of sulphamic acid.

Reactor Temperature

[0078] The temperature in the reactor is calculated based on the reactor pressure according to the Antoine equation as follows:

$$\log_{10} p = A - B/(C+T)$$

in which p is the reactor pressure in bar (10⁵ Pa), T is the reactor temperature in K and the three constants have the following values:

A = 3.97323, B = 1016.865, C = -56.623

Reactor pressure & external pressure

[0079] Pressure is measured using a piezo-resistive pressure transmitter Rosemount™ 3051 Coplanar™.

pH

[0080] pH is measured using a Rosemount™ type 385 pH/ORP sensor.

Flow Rate

[0081] Flow rates are measured using a Rosemount™ type 8732 Magnetic Flowmeter System.

Summary of the Figures

[0082] The invention is now further elucidated with reference to the figures. The figures and figure descriptions are exemplary and are not to be considered as limiting the scope of the invention. The figures and descriptions focus on the features of the process relating to the invention and are not intended to be a comprehensive description of already established processes. The skilled person is aware of the technical details required to implement parts of the process which fall outside the focus of the invention, such as standard processes for distillation, phase separation and drying.

Figure 1 is a schematic showing material flows in a process according to the invention.

Figure 2 is a schematic process flow showing the steps of the invention

Figure 3 is the graph showing the influence of water content in the production of diammonium sulphate on energy efficiency.

Figure 4 is a graph showing the influence of circulation ratio on the conversion yield of sulphuric acid to diammonium sulphate as well as on pump parameters.

Description of the Figures

[0083] Figure 1 is a schematic showing material flows in a process according to the invention. A first stream 102 arising from a preparation process for acesulfame, comprising triethyl amine, sulphuric acid and water along with other trace constituents and a second stream 101 of liquid ammonia are introduced into a circuit to obtain a cycle stream, the first stream at point B and the second stream at point A in the circuit. The cycle stream is cooled or heated in a heat exchanger 103 and passed to a phase separator 104 at point C in the circuit. In the phase separator 104, a portion of the cycle stream called the third stream is separated into a liquid fifth stream comprising diammonium sulphate and H₂O and a gaseous fourth stream comprising triethyl amine and H₂O. Part of the fifth stream is circulated into the cycle stream, in this case 8 to 15 times the flow of the first stream. The portion of the fifth stream leaving the circuit proceeds to be contacted with steam 105 to obtain aqueous diammonium sulphate solution which proceeds to further processing 106 and a steam portion which joins with the fourth stream. The further processing of the fifth stream comprises a solidification to obtain solid diammonium sulphate. The fourth stream along with the added steam component is distilled 107 into triethyl amine 108, which can be reused in the preparation of acesulfame, and a water fraction 109 which can be circulated back into the first stream 102.

[0084] Figure 2 is a schematic process flow showing the steps of the invention. In a step a. 201 SO₃ and acetoacetamide-N-sulphonic acid are contacted to form an acesulfame. A first stream comprising H₂O, triethyl amine and sulphuric acid results from this step. In a step b. 202 a second stream of liquid ammonia is provided. In a step c. 203 a circuit is provided. In a step d. 204, the first and second streams are introduced into the circuit to obtain a cycle stream. In a step e. 205 a third stream is removed from the cycle. The third stream may be separated into a volatile fourth stream comprising triethyl amine and H₂O and a liquid fifth stream comprising H₂O and diammonium sulphate in a separation step f. The fifth stream may subsequently be contacted with H₂O in the form of steam in step g₁ 206 and the resultant diammonium sulphate subsequently solidified in step g₂ 207. The fourth stream may be distilled in a step h. 208 to separate into a triethyl amine phase and a H₂O phase. Purified triethyl-amine leaves the distillation at the column bottom.

[0085] Figure 3 further elucidates the influence of water content in the diammonium sulphate (DASA) solution (stream passing to solidification 106). The power requirements for drying are influenced by the water content. The power consumption was measured over the course of an hour

[0086] Figure 4 shows the effect of varying the circulation ratio on the proportional conversion of sulphuric acid into diammonium sulphate as well as the Reynolds number and energy consumption for the pump. The parameters were measured over the course of an hour.

Examples

[0087] The invention is now further elucidated with the aid of examples. These examples are for illustrative purposes and are not to be considered as limiting the scope of the invention.

General Procedure

[0088] A process was set up according to figure 1. The contacting step a. in which the acesulfame was created was performed as follows. The acetoacetamide-N-sulphonic acid supply was the triethylammonium salt of Acetoacetamide-N-sulphonic acid dissolved in dichloromethane (DKA) at a concentration of 1.5 molar. The SO₃ supply was SO₃ dissolved in dichloromethane (DCM/SO₃) at a concentration of 5 molar. The two supplies were provided to the reactor with volume flow ratio DKA:DCM/SO₃ of 1:1.2. A hydrolysis bed was provided with a flow of H₂O which was adjusted such that the

ratio of sulphuric acid:H₂O by weight in the hydrolysis products was maintained in the range from 3:1 to 1:1. The sulphuric acid and triethyl amine products of the contacting and hydrolysis reaction were extracted using excess dichloromethane resulting in the first stream comprising 43 to 55 wt. % sulphuric acid and 10 to 12 wt. % triethyl amine in aqua. Pure liquefied ammonia or ammonia solutions were employed as the second stream. 10 times the input of the first stream was circulated to the cycle stream.

Examples 1 to 7

[0089] In Examples 1 to 4 the quantity of H₂O was varied in the hydrolysis step yielding the concentrations in the first stream shown in table 1. The concentration of ammonia in the second stream in these examples was 100 wt.% (liquid ammonia). In examples 5 to 7 the first stream was the same as in example 1. Here the ammonia concentration in the second stream was varied, firstly taking the maximum soluble content in water at 20°C of 36 wt. % (example 5), secondly taking a commercially employed value of 25 wt. % (example 6) and thirdly taking the value 21 wt. % (example 7).

Table 1:

Example	Contents of first stream [wt. %]				Content of second stream [wt. %]
	H ₂ SO ₄	H ₂ O	TEA	AcOH*TEA	NH ₃
1	55	30	12	3	100
2	51	35	11	3	100
3	47	40	11	2	100
4	43	45	10	2	100
5	55	30	12	3	32
6	55	30	12	3	25
7	55	30	12	3	21

[0090] Results for the power requirement for spray drying of the diammonium sulphate are shown in table 2 and presented in figure 3. The power consumption was measured over the course of an hour.

Table 2: Energy Efficiency

Example	H ₂ O content in DASA production [wt. %]	Spray drying kW/kg DASA
1	30	0.226
2	35	0.284
3	40	0.363
4	45	0.439
5	50	0.542
6	55	0.655
7	60	0.82

Example 8

[0091] The procedure was repeated according to example 1, except that the circulation ratio was varied as per table 3. The proportion of sulphuric acid converted, the Reynolds number and the pump power demand are also displayed in table 3. Results are displayed in figure 4. The parameters were measured over the course of an hour.

Table 3

Example	Circulation ratio	Conversion of sulphuric acid [%]	Reynolds number	Pump power demand (Normalised)
8a	3	82	930	1

Claims

10 1. A process for the preparation of a product, the product being 6-methyl-3,4-di-hydro-1,2,3-oxathiazin-4-one 2,2-dioxide or a salt thereof, the process comprising the following steps:

- a. Contacting SO₃ and acetoacetamide-N-sulphonic acid or a salt thereof in the presence of an amine, thereby obtaining a first stream comprising the amine and sulphuric acid;
- 15 b. Providing a second stream comprising ammonia;
- c. Providing a circuit;
- d. Introducing the second stream into the circuit at point A and the first stream into the circuit at point B to obtain a cycle stream cycling in the circuit;
- e. Removing a portion of the cycle stream at a point C to obtain a third stream;

20 wherein the circulation ratio is in the range from 3 to 30, the circulation ratio being the value of the mass flow rate of the cycle stream immediately preceding point A F_c divided by the value of the mass flow rate of the first stream into the circuit at point B F_1 according to the following formula:

$$\text{circulation ratio} = F_c/F_1$$

2. The process according to claim 1, wherein the amine is triethyl amine.

30 3. The process according to claim 1 or 2, wherein the third stream is removed from the cycle stream at a point C and the points A, B & C are ordered in the direction of the flow of the cycle stream in the circuit.

4. The process according to any of the preceding claims, wherein the second stream does not comprise more than 50 wt. % H₂O.

35 5. The process according to any of the preceding claims, wherein the second stream is a liquid.

6. The process according to any of the preceding claims, wherein the second stream is at a pressure in the range from 0.2 to 1.5 MPa.

40 7. The process according to any of the preceding claims, further comprising the following step:

- f. Separating the third stream to obtain a fourth stream comprising the amine and a fifth stream comprising diammonium sulphate;

45 wherein the fourth stream comprises a higher wt. % of the amine than the first stream; wherein the fourth stream comprises a lower wt. % of diammonium sulphate than the first stream;
 wherein the separation is made by phase separation into a liquid and a gas phase.

8. The process according to claim 7, wherein the fifth stream is contacted with H₂O in a step g₁.

50 9. The process according to claim 8, wherein least part of the H₂O is present in step g₁ in a gaseous state, preferably all the H₂O.

10. The process according to any of the claims 7 to 9, wherein the mass ratio of the fourth stream to the fifth stream is in the range from 30:70 to 1:99.

55 11. The process according to any of the claims 7 to 10, wherein the content of H₂O in the fifth stream is reduced in a step g₂, wherein the step g₂ is a solidification.

12. The process according to any of the claims 7 to 12, wherein the fourth stream is separated into a sixth stream and a seventh stream in a step h;

wherein the seventh stream comprises more H₂O than the sixth stream;

wherein the sixth stream comprises more of the amine than the seventh stream, in 13, wherein the step h is a distillation.

13. The process according to any of the preceding claims, wherein the cycle stream is heated or cooled.

14. A use of the process according to any of the preceding claims for making diammonium sulphate.

Patentansprüche

1. Verfahren zur Herstellung eines Produkts, wobei das Produkt 6-Methyl-3,4-dihydro-1,2,3-oxathiazin-4-on-2,2-dioxid oder ein Salz davon ist, wobei das Verfahren die folgenden Schritte umfasst:

a. Inkontaktbringen von SO₃ und Acetoacetamid-N-sulfonsäure oder eines ihrer Salze in Gegenwart eines Amins, wodurch ein erster Strom erhalten wird, der das Amin und Schwefelsäure enthält;

b. Bereitstellen eines zweiten Stroms, der Ammoniak enthält;

c. Bereitstellen eines Kreislaufs;

d. Einleiten des zweiten Stroms in den Kreislauf an Punkt A und des ersten Stroms in den Kreislauf an Punkt B, um einen zyklischen Strom im Kreislauf zu erhalten;

e. Entnahme eines Teils des Kreislaufstroms an einem Punkt C, um einen dritten Strom zu erhalten;

wobei das Zirkulationsverhältnis im Bereich von 3 bis 30 liegt, wobei das Zirkulationsverhältnis der Wert des Massendurchsatzes des Kreislaufstroms unmittelbar vor dem Punkt A F_c geteilt durch den Wert des Massendurchsatzes des ersten Stroms in den Kreislauf am Punkt B F_1 gemäß der folgenden Formel ist:

$$\text{Zirkulationsverhältnis} = F_c / F_1$$

2. Verfahren nach Anspruch 1, wobei das Amin Triethylamin ist.

3. Verfahren nach Anspruch 1 oder 2, wobei der dritte Strom an einem Punkt C aus dem Kreislaufstrom entfernt wird und die Punkte A, B und C in Richtung des Flusses des Kreislaufstroms im Kreislauf angeordnet sind.

4. Verfahren nach einem der vorhergehenden Ansprüche, wobei der zweite Strom nicht mehr als 50 Gew.-% H₂O enthält.

5. Verfahren nach einem der vorhergehenden Ansprüche, wobei der zweite Strom eine Flüssigkeit ist.

6. Verfahren nach einem der vorhergehenden Ansprüche, wobei der zweite Strom einen Druck im Bereich von 0,2 bis 1,5 MPa aufweist.

7. Das Verfahren nach einem der vorhergehenden Ansprüche, das außerdem den folgenden Schritt umfasst:

f. Trennen des dritten Stroms, um einen vierten Strom, der das Amin enthält, und einen fünften Strom, der Diammoniumsulfat enthält, zu erhalten;

wobei der vierte Strom einen höheren Gew.-%-Anteil des Amins als der erste Strom enthält;

wobei der vierte Strom einen geringeren Gew.-%-Anteil an Diammoniumsulfat als der erste Strom enthält.

8. Verfahren nach Anspruch 7, wobei der fünfte Strom mit H₂O in einem Schritt g_1 in Kontakt gebracht wird.

9. Verfahren nach Anspruch 8, wobei zumindest ein Teil des H₂O in Schritt g_1 in gasförmigem Zustand vorliegt, vorzugsweise das gesamte H₂O.

10. Verfahren nach einem der Ansprüche 7 bis 9, wobei das Massenverhältnis des vierten Stroms zum fünften Strom

im Bereich von 30:70 bis 1:99 liegt.

11. Verfahren nach einem der Ansprüche 7 bis 10, wobei der Gehalt an H_2O im fünften Strom in einem Schritt g_2 reduziert wird, wobei der Schritt g_2 eine Verfestigung ist.

12. Verfahren nach einem der Ansprüche 7 bis 11, wobei der vierte Strom in einem Schritt h in einen sechsten Strom und einen siebten Strom getrennt wird;

wobei der siebte Strom mehr H_2O enthält als der sechste Strom;

wobei der sechste Strom mehr Amin enthält als der siebte Strom, wobei der Schritt h eine Destillation ist.

13. Verfahren nach einem der vorhergehenden Ansprüche, wobei der Kreislaufstrom erhitzt oder gekühlt wird.

14. Verwendung des Verfahrens nach einem der vorangehenden Ansprüche zur Herstellung von Diammoniumsulfat.

Revendications

1. Procédé de préparation d'un produit, le produit étant le 2,2-dioxyde de 6-méthyl-3,4-dihydro1,2,3-oxathiazin-4-one ou un sel de celui-ci, le procédé comprenant les étapes suivantes :

a. Mise en contact du SO_3 et de l'acide acétoacétamide-N-sulfonique ou d'un de ses sels en présence d'une amine, pour obtenir un premier flux comprenant l'amine et l'acide sulfurique ;

b. Fournir un second flux comprenant de l'ammoniac ;

c. Fournir un circuit ;

d. Introduire le second flux dans le circuit au point A et le premier flux dans le circuit au point B pour obtenir un flux cyclique dans le circuit ;

e. Retirer une partie du flux du cycle en un point C pour obtenir un troisième flux ;

dans lequel le rapport de circulation est dans la gamme de 3 à 30, le rapport de circulation étant la valeur du débit massique du flux de cycle précédant immédiatement le point A F_c divisé par la valeur du débit massique du premier flux dans le circuit au point B F_1 selon la formule suivante :

$$\text{rapport de circulation} = F_c / F_1$$

2. Procédé selon la revendication 1, dans lequel l'amine est la triéthylamine.

3. Procédé selon la revendication 1 ou 2, dans lequel le troisième flux est retiré du flux de cycle en un point C et les points A, B et C sont ordonnés dans la direction de l'écoulement du flux de cycle dans le circuit.

4. Procédé selon l'une quelconque des revendications précédentes, dans lequel le second flux ne comprend pas plus de 50 % en poids de H_2O .

5. Procédé selon l'une quelconque des revendications précédentes, dans lequel le second flux est un liquide.

6. Procédé selon l'une quelconque des revendications précédentes, dans lequel le second flux est à une pression comprise entre 0,2 et 1,5 MPa.

7. Le procédé selon l'une quelconque des revendications précédentes, comprenant en outre l'étape suivante :

f. Séparation du troisième flux pour obtenir un quatrième flux comprenant l'amine et un cinquième flux comprenant le sulfate de diammonium ;

dans lequel le quatrième flux comprend un pourcentage en poids de l'amine supérieur à celui du premier flux ;

dans lequel le quatrième flux comprend un pourcentage en poids de sulfate de diammonium inférieur à celui du premier flux.

8. Procédé selon la revendication 7, dans lequel le cinquième flux est mis en contact avec H_2O dans une étape g_1 .

EP 3 740 471 B9

9. Procédé selon la revendication 8, dans lequel au moins une partie du H_2O est présente dans l'étape g_1 à l'état gazeux, de préférence la totalité du H_2O .

10. Procédé selon l'une quelconque des revendications 7 à 9, dans lequel le rapport massique du quatrième flux sur le cinquième flux est compris entre 30:70 et 1:99.

11. Procédé selon l'une quelconque des revendications 7 à 10, dans lequel la teneur en H_2O dans le cinquième flux est réduite dans une étape g_2 , dans lequel l'étape g_2 est une solidification.

12. Procédé selon l'une quelconque des revendications 7 à 11, dans lequel le quatrième flux est séparé en un sixième flux et un septième flux lors d'une étape h ;

dans lequel le septième flux comprend plus de H_2O que le sixième flux ;

dans lequel le sixième flux comprend une plus grande quantité d'amine que le septième flux,

dans lequel l'étape h est une distillation.

13. Procédé selon l'une quelconque des revendications précédentes, dans lequel le flux du cycle est chauffé ou refroidi.

14. Utilisation du procédé selon l'une quelconque des revendications précédentes pour la fabrication de sulfate de diammonium.
